Construction Management Option Pedestrian Walkback Tunnel, Finishes Package Washington Dulles International Airport Primary Faculty Consultant: Riley Due Date: Wednesday, October 8<sup>th</sup>, 2003

# Technical Assignment #1 Existing Site Conditions

### Executive Summary

The construction of any tunnel is unique, but when you put that tunnel underneath a fully operating airport what you get is a challenge. Fully operational terminals, airline gates, mobile lounge docks and taxiways surrounding the project make for a job site that requires the utmost in project safety, communication and planning. Only through the process of analyzing the basic requirements and then looking at the unknown variables can the project team carry out a successful project.

The Metropolitan Washington Airports Authority has chosen to take this project one step at a time, from the design, to the construction of the shell of the tunnel, to the finishing out of the tunnel, to the integration of the tunnel to the existing concourses. Further projects are on their way including the extension of the tunnel to Concourse A, and the installation of the underground automated people mover system. MWAA will certainly encounter some of the same processes used for that project, so it would be worth the additional effort now to consider the best methods for the job.

Current construction projects all over the airport are occurring with little or no interference with flights and other airport operations. Design and phasing of these projects is key in order to maintain a fully operational airport among millions of dollars in construction.

### **Project Schedule Summary**

Before the groundbreaking for the new Connector B building could begin, the existing Mobile Lounge Dock, which transported passengers from Concourse B to the other terminals, would need to be demolished as well as the existing concrete apron inside the future building's footprint.

At the same time, the tunnel will be prepped to meet OSHA standards. A proper ventilation system will be installed as well as other safety precautions for work in the confined space. Once the tunnel is ready for work, the 4' high curb walls will be poured. These curb walls will be the framework for the moving walkways as well as supporting the precast planks for the slab. MEP rough-in will commence shortly after the curb walls have started.

The earthwork process for the Connector B would consist of 6 main activities. First, due to the rock on site, a rock grinder needs to perform a production grind at a lift of 6 to 8 feet deep. The ground-up rock fragments are backfilled into the trenches created by the rock grinder. Once the entire zone is ground, the soil can be excavated from the hole and hauled to the airport's soil bank. Once a section of the earth wall approximately 6-8 feet in height is excavated, tie backs can begin to be installed. A layer of shotcrete will be sprayed before the tieback is stressed, after which another layer of shotcrete is applied. This completes the earthwork cycle.

The foundation process will consist of pouring the 6' thick matte slab. Seeking a challenge (and also for structural reasons), the entire slab area of 170' x 80' will be poured at once. The below grade walls will be 4' thick and poured in 2 lifts, dividing each lift into 15 separate pours.

In the tunnel, the topping slab will be poured after the precast planks are set. The walls will be framed up and roughed-in with MEP components. The suspended ceiling will be installed, as well as the lengthy process of installing the 6 moving walkways. Once the walkways are nearly complete, the finishes in the tunnel can go in to match the rest of the airport's public spaces.

The steel superstructure for Connector B will establish the frame for the 2 stories above grade. Once complete, the building enclosure and subsequently the building finishes will be installed.

The completion of the project is currently in late December, however the owner is currently looking into accelerating the project to have the tunnel in operation for the 2004 Thanksgiving holiday.

### **Project Delivery System**

While this project has aspects of design-build, it more closely resembles a traditional design-bid-build system. Design is continuing on some finishes after award of the contract, but based on the organizational structure it is a traditional approach. Due to the owner being Metropolitan Washington Airports Authority (MWAA), an owner that does not have experience nor the personnel for managing construction, a representative is contracted for a set period of time to manage all of MWAA's projects. The owner's representative for construction is Parsons Management Consultants (PMC), and PMC Design for managing the design process. The contracts between MWAA and PMC are both fee based.

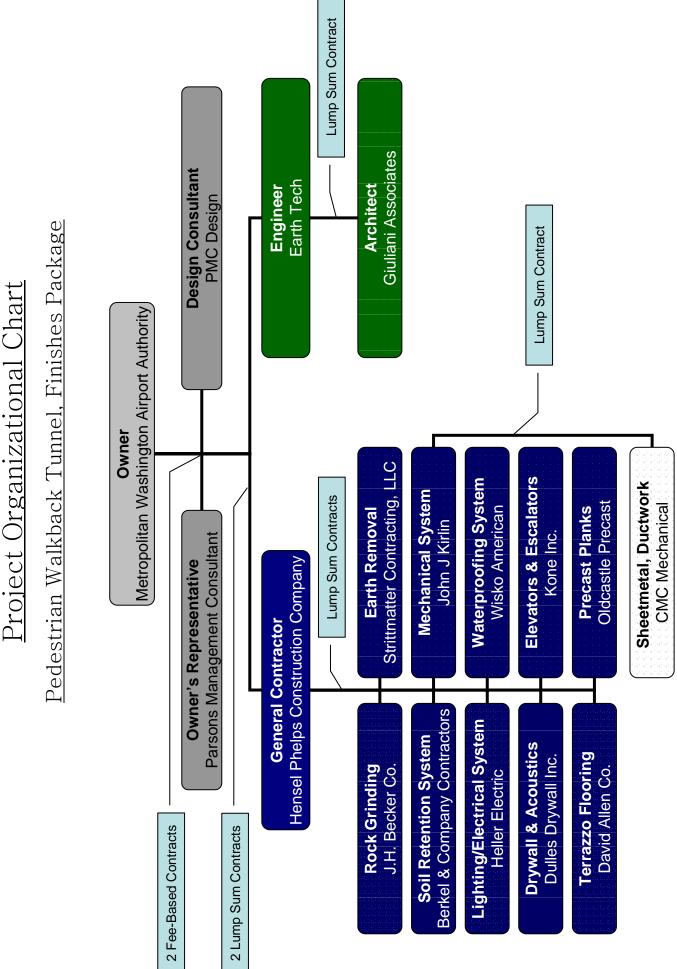

The project was designed by Earth Tech, an engineering firm, who subcontracted the architectural design to Giuliani Associates. The reason for this backward approach was due to the construction of the tunnel's shell. Earth Tech was brought onto the project early to design the tunnel shell, and only later was Giuliani Associates contracted to design the exterior of the connector buildings and the aesthetics of the project. The contract between MWAA and Earth Tech is lump sum, as is the subcontract that Earth Tech holds with Giuliani Associates.

Hensel Phelps Construction Company (HPCC) is the general contractor for the project. HPCC bid on the project in September of 2002 after receiving a Request For Proposal two months earlier in July. HPCC has a lump sum contract with MWAA, and will hold multiple lump sum subcontracts with each subcontractor for the job.

Hensel Phelps Construction: Matt Krstolic (703) 572–1810 mkrstolic@henselphelps.com

# **Project Cost Evaluation**

Note: Below is an approximate summary of current costs on the project. They are approximate values and therefore should not be relied upon for accuracy beyond the scope of this project.

Actual building construction costs (not including the tunnel shell due to a confidentiality request by the owner):

Total: \$19,000,000 Unit Cost: \$400/SF

Current total project costs (not including the tunnel shell or design fees due to a confidentiality request by the owner):

Total: \$24,500,000 Unit Cost: \$515/SF Approx. Tunnel Electrical Costs: Total: \$735,000 Unit Cost: \$32.67/SF Approx. Tunnel Mechanical Costs: Total: \$402.000 Unit Cost: \$17.87/SF Approx. Connector Electrical Costs: Total: \$1,365,000 Unit Cost: \$54.60/SF Approx. Connector Mechanical Costs: Total: \$938,000 Unit Cost: \$37.52/SF

Design costs: Unable to provide due to its sensitivity to the owner

### <u>RS Means Estimate</u>

Using RS Means gives a unit cost of approximately \$95.30/SF. While this is for a bus terminal, it is the closest building the publication contains data for. There are several key reasons why this unit cost is so different. It does not include site work or general conditions, any conveying systems (i.e. elevators, escalators, power walks), no basement, and only one story. It is also is described for a maximum of 22,000 SF building, steel frame and face brick with concrete block back-up. If using this unit cost, this building would accumulate to approximately \$4.5 million. This is clearly absurd, therefore a more detailed means of estimation would be needed for an accurate estimate.

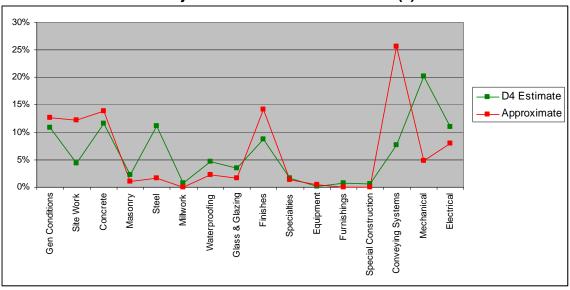

## **Project Cost Evaluation Continued**

| <u>Using D4 Cost Estin</u> | mating software, the following results were obtained: |
|----------------------------|---|
| General Conditions         | 11% @ \$685,029                                       |
| Site Work:                 | 4% @ \$277,929  |
| Concrete:                  | 12% @ \$727,482                                       |
| Masonry:                   | 2% @ \$146,035  |
| Steel:                     | 11% @ \$702,979                                       |
| Millwork:                  | 1% @ \$48,589   |
| Waterproofing:             | 5% @ \$297,164  |
| Glass & Glazing:           | 4% @ \$221,859  |
| Finishes:                  | 9% @ \$546,628  |
| Specialties:               | 2% @ \$102,011  |
| Equipment:                 | 1% @ \$10,471   |
| Furnishings:               | 1% @ \$42,744   |
| Special Const.:            | 1% @ \$33,313   |
| Conveying Sys.:            | 8% @ \$482,744  |
| Mechanical:                | 20% @ \$1,269,514                                     |
| Electrical:                | 11% @ \$691,689                                       |
| Total:                     | \$6,286,000   |

While this estimate is extremely different from the actual cost of the project, it is understandable due to the large percentage of the Dulles contract taken up by the moving walkways, between \$6-\$7 million dollars. The following graph shows a comparison of an estimate of the distribution of the assumed actual costs to the distribution of the D4 Estimate costs.

# Project Cost Evaluation Continued(2)

As demonstrated by the graph, the conveying systems throw the percentage off greatly, rendering the D4 results ineffective in creating a reasonable estimate.

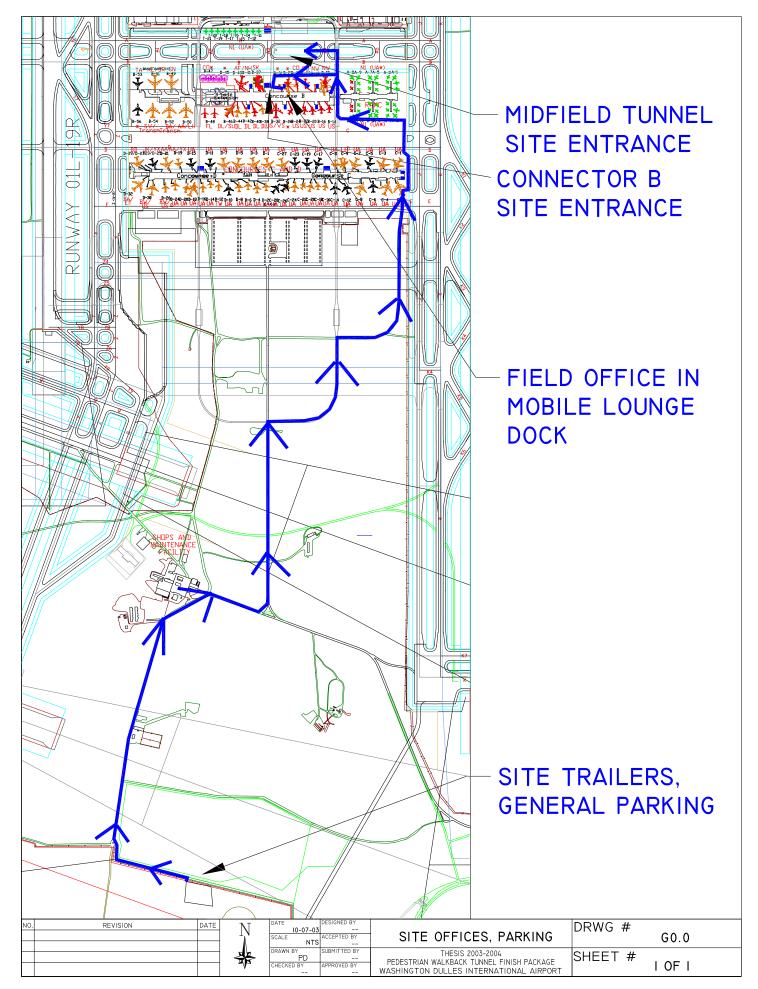

### Site Plan

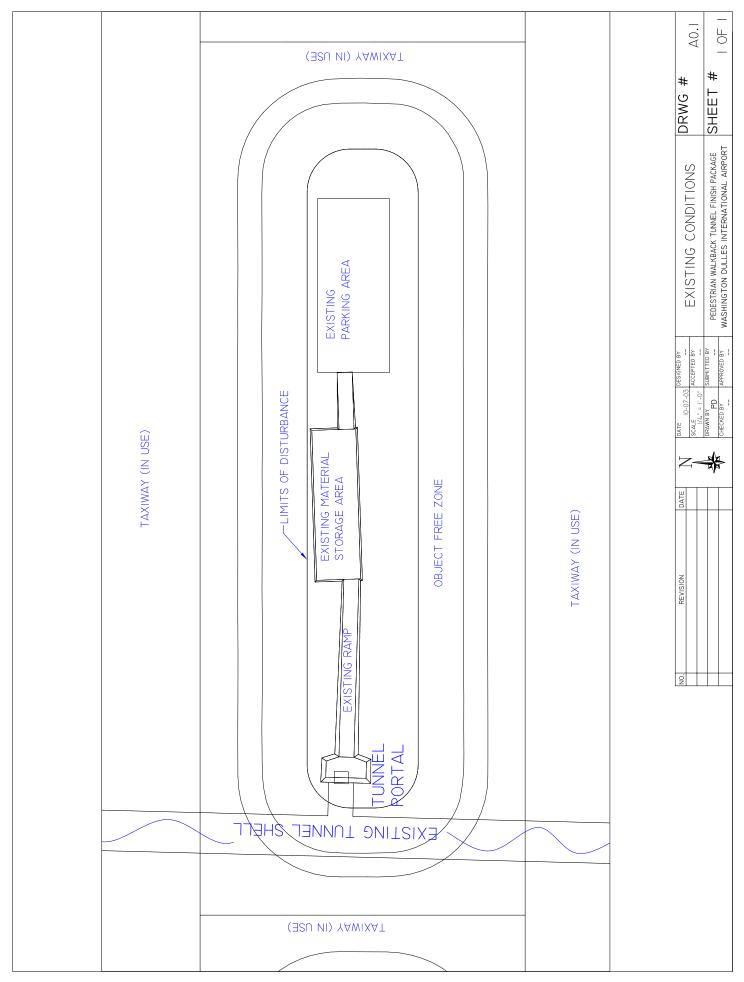

As seen by the following site plans, the project is spread out over a large area. With the trailers over 3 miles from the actual construction site, it is extremely beneficial that a field office was able to be established under an operating mobile lounge dock. Even the Tunnel and the Connector B structures are difficult travel back and forth. While the two sites will eventually be connected, until that time, all workers must drive between the two sites amongst baggage carts, mobile lounges, airplanes, and other airport traffic. All of these factors have a big impact on each worker's productivity in a day, and therefore requires careful planning of where the work is that needs to be done.

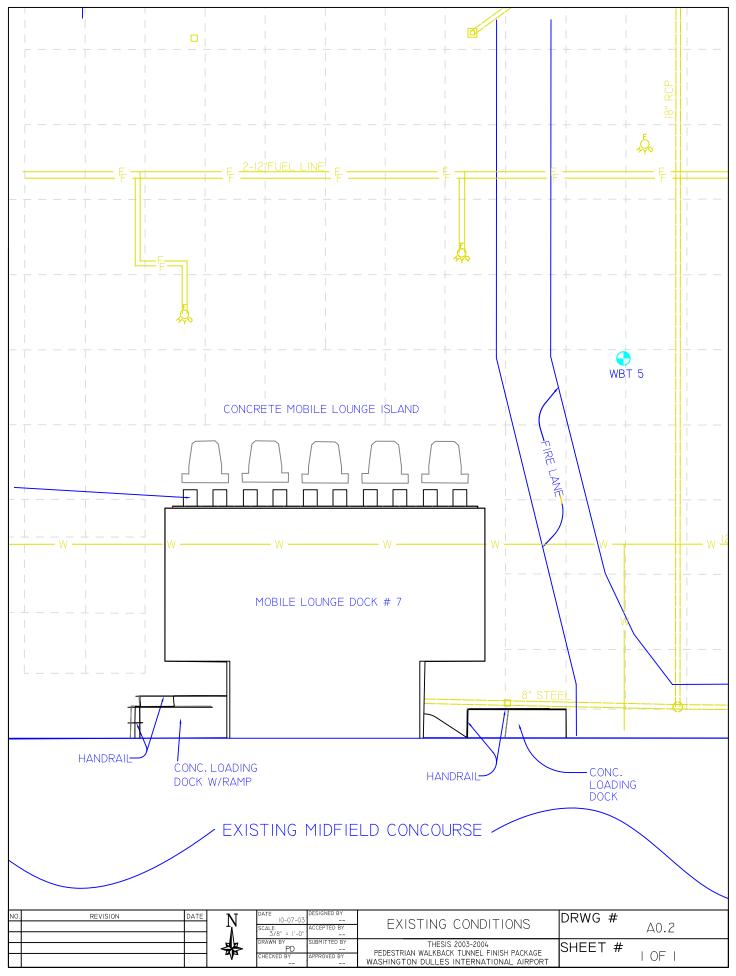

The existing conditions of the midfield tunnel staging area are shown, along with temporary storage areas and ramps to reach tunnel level. It should be noted that materials can be stored within the specified zones, however the height limits must be consulted in order to keep vision lines clear between the control towers and the runways, taxiways and service roads.

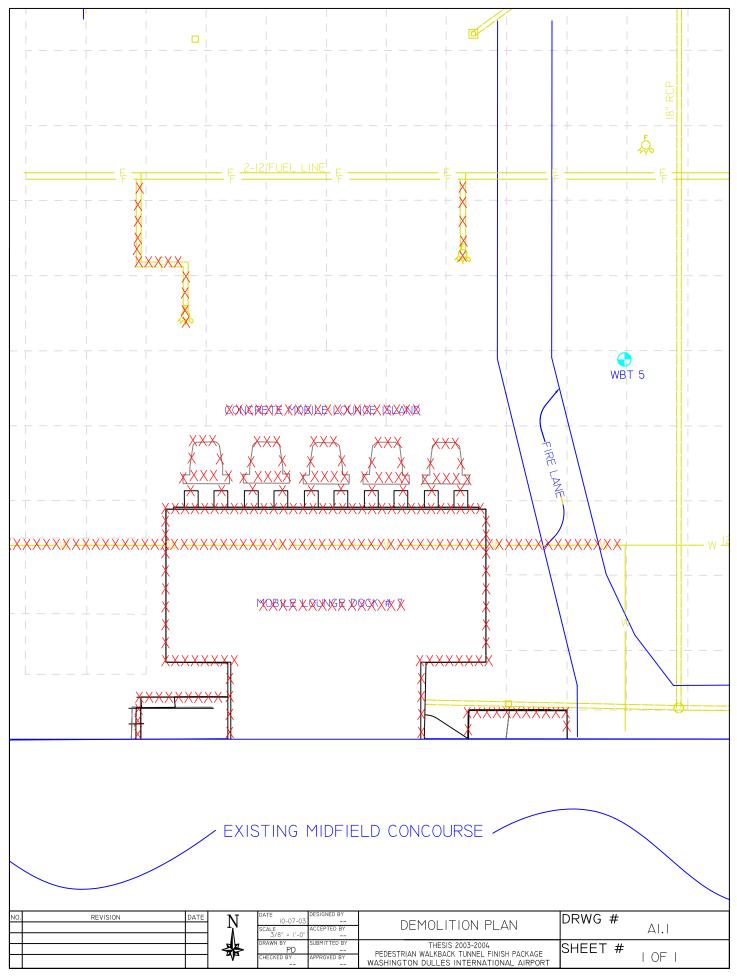

The existing conditions of the connector show the Mobile Lounge Dock #7 and adjacent facilities. As seen on the demolition plan, these will need to be demolished before excavation can begin. During the excavation and foundations phases, the site will be very constricted. This is due to the active gates on either side of the project. The construction fence is set on top of Jersey Barriers to protect the site, and also to protect the planes adjacent to the site. Even though there are no pedestrians, extra precautions must be taken for airline personnel, and even passengers at times, that may be on the apron in the vicinity of the construction site.

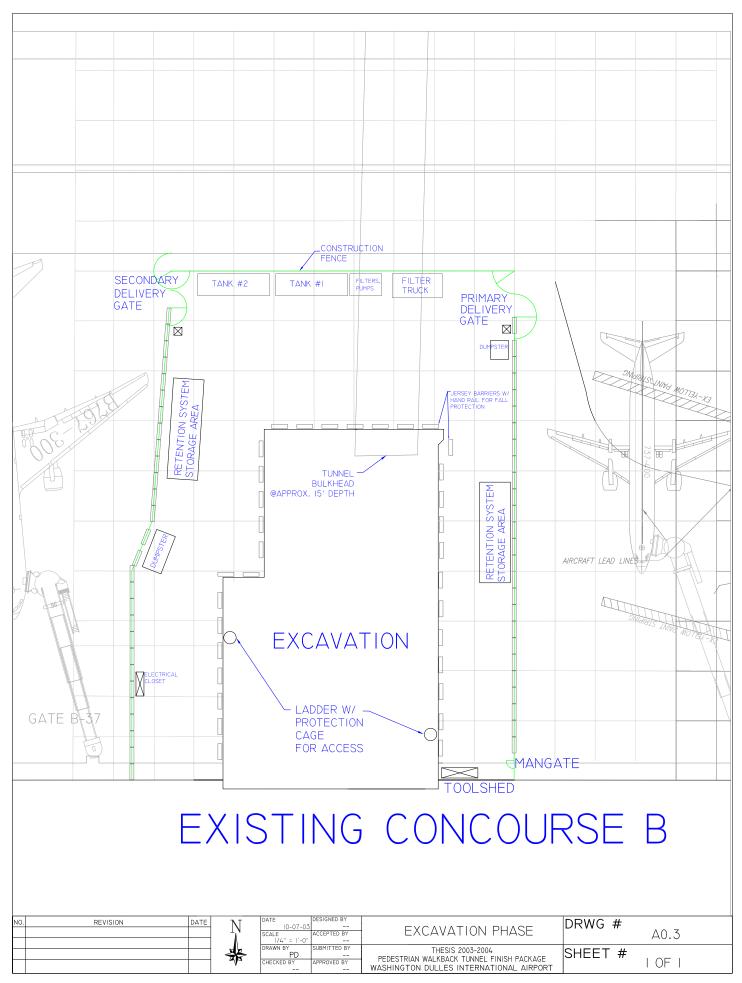

As seen on the steel erection phase, the site will become much more spacious due to the smaller above grade footprint. Considerations must be made to ensure steel is on site in order, and due to the variability in driving times on the airport, this layout will allow for storage of steel onsite. This will decrease the chance of a steel delivery not getting to the site on time and holding up work. Materials such as drywall, masonry and framing members will be stored inside the building to protect from the environment and free up space on the site.

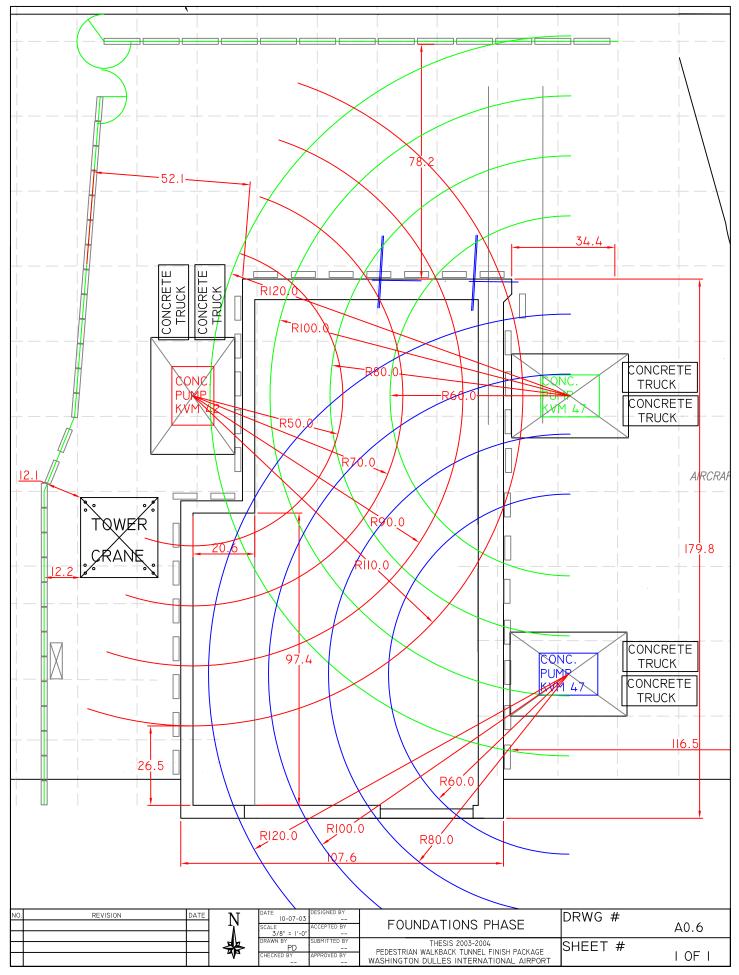

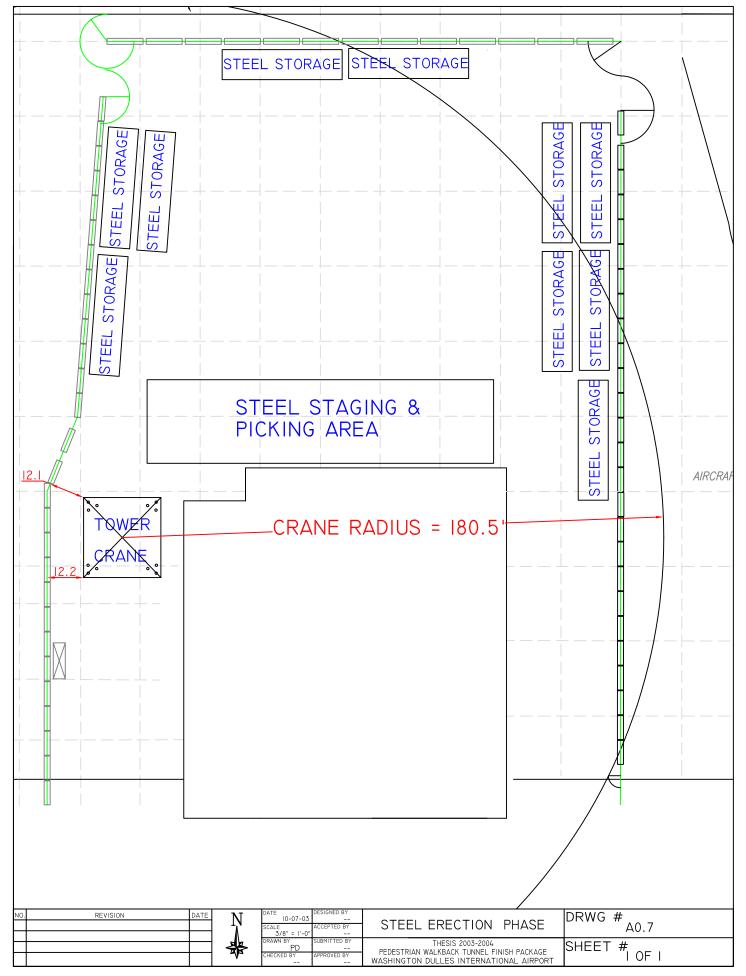

### **Local Market Conditions**

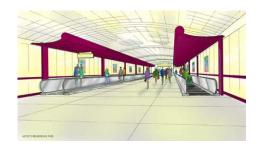

Being very close to Washington, D.C. there is a large labor market to pull from. However there are a few issues which must be carefully considered. There is a lot of construction occurring in the area making the seemingly flooded labor market very sparse. Another issue is the lack of skilled labor. It is not as hard to find a laborer as it is to find a carpenter or a pipe fitter. Due to this fact, considerations should be made when estimating costs and also productivity on the project.

Hensel Phelps will be self performing a considerable amount of work for this job, making this issue a priority. Hensel Phelps employs many workers from the Washington, D.C. and surrounding areas, however the firm has many projects ongoing at this time. There is a great demand for their workers, and any down time on a project will hurt not just that job, but all of the firms other jobs in the area. This will require coordination on HPCC's part to maintain a consistent workforce that is most efficient for their projects as a whole.

Washington, D.C. is known as a union labor force, however unions have become less dominant. Most of the work performed on this project will be nonunion, however there will be subcontractors which are union.

The Pedestrian Walkback Tunnel project has a 28% Local Disadvantaged Business Enterprise (LDBE) participation requirement. The Request For Proposal (RFP) defines *local* as "within a 100-mile radius of Washington, D.C.'s zero mile marker". This includes any county touched by that radius. The term *disadvantaged business* is defined as "a firm which is not dominant in its field, and which meets the ... size standard(s) for this solicitation." If the 28% is not obtained, the RFP dictates that the contractor must meet the requirement through subcontracts, or through partnering with an owner certified LDBE. Changes after the award of the contract are encouraged to preserve the established 28% through the completion of the project.

A voluntary MBE/WBE participation percentage has been established by the Metropolitan Washington Airports Authority at 28%. If participation is obtained, Exhibit D must be filled out for monitoring purposes, but will not be used to determine to whom the contract is awarded. Most MBEs and WBEs will also qualify as an LDBE.

### Subsurface/Soils

Excavation will amount to about 35,000 CY at the site of Connector B. A geotechnical report was provided to all bidders at the time of bidding. From the report, the following conditions should be anticipated below grade:

- 287–285 AMSL: Portland cement concrete
- 285-284 AMSL: Gray sand with some gravel
- 284-281 AMSL: Reddish brown clay
- ~276-281 AMSL: Decomposed/weathered rock
- ~270-280 AMSL: Bedrock with RQD between 36% and 95%
  -Note: An RQD below 75 means the rock is of fair quality at best

It was also noted by the report that the soil had a distinct fuel odor to it. The soil near the site is known to be contaminated due to a fuel line break on a previous phase of the project. All excavated soil will be anticipated as being contaminated, however this should not be an issue due to the use of a soil bank operated by the owner.

Due to the anticipation of the soil having less than ideal qualities, a soil retention system is used on the site. As mentioned in the scheduling report, a system incorporating tiebacks and multiple layers of shotcrete is used. The design is consistent for the depth of the excavation, barring the length of the tiebacks.

On the south face of the excavation, three existing caissons 4'-3" wide support the existing Concourse B. These caissons extend past the depth of the excavation, but are braced midway down to prevent any bowing or possible failure. A similar tieback/shotcrete system is used that incorporates tube steel to embrace the caisson.

The HPCC's contract with MWAA contains a Differing Site Conditions (DSC) clause. It is currently an issue on site due to the east face of the excavation having continued failures due to the clay veins found in the bedrock. While this was detailed in the geotechnical report, the extent of the veins was not and therefore could not be anticipated. The bedrock itself is solid, however it is highly jointed and severely weathered.

Relating to this issue is the additional costs due to the record amount of rainfall in the Washington, D.C. area this year. All groundwater must be removed from the excavation and disposed of. However due to the contamination of the soil, the water must be filtered through an intensive process before being sent to the storm sewer. The added volume of rain adds substantial costs to the dewatering process.

### **Client Information**

Metropolitan Washington Airport Authority is building this project to allow passengers the choice between a short walk between the Main Terminal and Concourse B (the tunnel will be extended to Concourse A in the future), or being transported via Mobile Lounge. While the Mobile Lounges are not yet obsolete, they are slowly being phased out as an underground automated people mover system is built (tentatively set to be introduced in 2008) to take their place. This underground automated people mover system will run side by side the Pedestrian Walkback Tunnel and closely resemble the same systems at Detroit's International Airport and others.

Even though this is a public entity, cost is not seen as the prime concern. Staying within budget is important, but many other factors must be taken into consideration. Safety is a substantial concern of the owner, even so far as to limit the bidders to those which had the highest safety ratings. Schedule is another principal interest of the owner. If the benefits of having the tunnel open for use on the Thanksgiving holiday weekend outweigh the cost of accelerating the schedule, they will certainly accelerate. Quality is less of an issue, but still important. This is not a temporary fix to a problem, as the Mobile Lounges seemed to be, the owner will operate this facility for a long time and reap the benefits of investing a little bit of extra money into it now. However that is not to say that it will look any different than the rest of the airport, it must blend in with all of the established color schemes and wall and floor textures. The owner has worked hard to establish a solid design with minimal maintenance and this is not something they are willing to compromise on.

From these considerations, success for this project will be timely completion. For the owner to have confidence in the project, it is best to show the current status of the project, and also give updates on the current projected date of completion. If problems arise, they should be discussed and resolved in a timely fashion to ensure no unnecessary delays in the schedule. Many decisions may rely on the owner, but the contractor must do their part to assist the owner in making the correct decision. A project completed safely, a project completed on time and a project completed as specified is the ultimate means of satisfying this owner.
