# Executive Summary

---

ANSI/ASHRAE Standard 62.1 – 2007, Ventilation for Acceptable Indoor Air Quality, establishes the method for design engineers to achieve the minimum air quality for a building. Section 5 of the standard establishes how mechanical systems and equipment obtain the necessary requirements to provide acceptable air quality, where section 6 of the standard focuses on the calculation of the minimum ventilation air required for each space in the building.

ANSI/ASHRAE Standard 90.1 – 2007, Energy Standard for Buildings..., explains how to “provide minimum requirements for the energy efficient design of buildings...” Section 5, Building Envelope Requirements, establishes requirements for the exterior construction of the building to comply with in order to be considered energy efficient. Section 6, Heating, Ventilating, and Air Conditioning, establishes the requirements for the buildings mechanical system to comply so that it can perform efficiently. Section 9, Lighting, establishes the amount of energy the lighting system of a building can consume.

North Pocono High School is a 230,000 ft.<sup>2</sup> building that has a variety of spaces that have unique requirements for each space. North Pocono’s mechanical system consists of 16 direct expansion air handler units with heating water coils that provide air to approximately 100 reheat VAV terminal units. The water supplied to the reheat units is heated by 2 7,000 MBH oil fired boilers. There are also some split air systems that serve areas that are not supplied by the main mechanical system.

After reviewing the building compliance of the standards, North Pocono overall meets the requirements established by the two standards, but there are areas where improvement can be made. Such as in the lighting density of the gym and office area, and the outdoor ventilation that is supplied to some of the zones as seen in the appendix C.

# Standard 62.1 - 2007

---

## *Systems and Equipment*

North Pocono has a relatively simple design, with many redundancies in the mechanical system; therefore many of the requirements in Standard 62.1 Section 5 are not applicable or are already met due the nature of the system. List below are the sections where compliancy is required.

### **5.3 Exhaust Duct Locations**

All exhaust ducts are negatively pressurized to ensure the contaminants carried by the ducts cannot leak into the spaces, and have a direct path to exhaust fans that are either roof mounted or ceiling mounted.

### **5.5.1 Resistance to Mold Growth**

After reviewing the construction documents it is determined that all materials have been determined to resist mold growth.

### **5.6.1 Outdoor Air Intake Location**

All outdoor intakes meet the minimum distance needed to comply with this section (see Appendix A).

### **5.6.2-5 Outdoor Conditions**

After reviewing the construction documents all of the outdoor equipment is in compliance with these sections.

### **5.11 Drain Pans**

After reviewing the construction documents all drain pans comply with this section.

### **5.12 Finned-Tube Coils and Heat Exchangers**

After reviewing the construction documents all finned-tube coils are in compliance with this section.

### **5.14 Access for Inspection, Cleaning, and Maintenance**

After reviewing the construction documents all equipment complies with this section.

## 5.15 Building Envelope

All exterior surfaces are specified to resist water permeation. All ductwork and piping is insulated in order to comply with this section.

### *Assumptions*

- Architectural plans with the furniture provided the correct design occupancy.
- Floor areas were correctly calculated on architectural floor plans.
- Nurse's cot rooms were categorized as class rooms to simplify the calculation.
- Some storage spaces and closets along with the mechanical room were excluded because they did not receive any outdoor air.
- AHU - 4,6,11 and 16 are for economizer only so the exhaust or return fans that serve those zones are properly sized; therefore they were not included in the system analysis.

### *Procedure*

The following procedure to determine the minimum outdoor air for each zone followed the steps set forth by Standard 62.1 Section 6.

**Step 1** Determine floor area ( $A_z$ ), design occupancy ( $P_z$ ), and total supply air to the zone ( $V_{pz}$ ).

**Step 2** Calculate the breathing zone outdoor airflow ( $V_{bz}$ ) using the following equation:

$$V_{bz} = A_z * R_a + P_z * R_p$$

$R_a$  and  $R_p$  can be found in Table 6-1 of Standard 62.1

$R_a$  = outdoor air required per unit area (cfm/ft<sup>2</sup>)

$R_p$  = outdoor air required per person (cfm/occupant)

**Step 3** Determine the zone distribution effectiveness ( $E_z$ ) from table 6-2

**Step 4** Determine the zone outdoor air flow ( $V_{oz}$ ) from the equation

$$V_{oz} = V_{bz} / E_z$$

**Step 5** Calculate the zone primary outdoor air fraction ( $Z_p$ ) from the following equation

$$Z_p = V_{oz}/V_{pz}$$

**Step 6** Determine the system ventilation efficiency ( $E_v$ ) from table 6-3 from Standard 62.1

**Step 7** Calculate the uncorrected outdoor air intake ( $V_{ou}$ ) from the following equation

$$V_{ou} = \sum_{\text{all zones}} (A_z * R_p) + \sum_{\text{all zones}} (P_z * R_a)$$

**Step 8** Calculate the outdoor air intake ( $V_{ot}$ ) from the following equation

$$V_{ot} = V_{ou}/E_v$$

A zone calculation can be found in Appendix B.

An alternate calculation is needed to determine  $E_z$  if it is above .55 which happens in some instances in my building so here is the alternate way to calculate  $V_{ot}$

**Step 6a** Determine  $X_s$  from the following equation

$$X_s = V_{ou}/V_{ps}$$

$$V_{ps} = \text{systems primary airflow (cfm)}$$

**Step 7a** Determine zone discharge airflow ( $V_{dz}$ )

**Step 8a** Determine discharge outdoor air fraction ( $Z_d$ ) from the following equation

$$Z_d = V_{oz}/V_{dz}$$

$$V_{dz} = \text{the overall air flow provided to the zone}$$

**Step 9a** Determine the system ventilation efficiency ( $E_{vz}$ ) from the following equation

$$E_{vz} = 1 + X_s - Z_d$$

Then continue with step 7 above.

A zone calculation with this method can be found in Appendix C.

The systems that were analyzed can be found in Appendix D.

## *Summary of Compliance*

Overall, the North Pocono mechanical system more than more than adequately ventilates the building, this could be due to the fact that airflows were calculated using the trace modeling program was used to determine the outdoor air required where the value for a Rp value for a classroom is 15 cfm/person and for an office it is 20 cfm/person, but there are some within most systems zones that fall short of meeting the requirement. This was probably due to cost restraints and therefore can easily be addresses with a simple change of equipment layout or duct work. A breakdown of each system analyzed is in Appendix D.

# Standard 90.1- 2007

---

## *Building Envelope*

Since the buildings fenestration percentage is less than 40% it is acceptable to use the prescriptive method. North Pocono is located in climate zone 5 and is a nonresidential building and will therefore have to comply with table 5.5-6.

**Table 1 - Opaque Element Compliance**

Element	Insulation R-Value	Standard Min. R-Value	Compliant	Assembly U-Value	Assembly Max. U-Value	Compliant
Roof	10	20	No	0.681	0.48	No
Wall Type 1	10	11.4	No	0.67	0.09	Yes
Wall Type 2	10	11.4	No	0.093	0.09	No
Slab on Grade	NR	NR	NR	0.213	0.73	Yes

**Table 2 - Fenestration Element Compliance**

Fenestration	Assembly U-Value	Assembly Max. U-Value	Assembly SHGC	Max SHGC	Compliant
Metal Framing	0.5	0.45	0.55	0.4	No

## *Heating, Ventilating, and Air Conditioning*

Since the building is larger than 25,000 ft<sup>2</sup> the Mandatory provisions method will have to be followed in order to determine if the system is in compliance with 90.1 Section 6. In the following tables are performance evaluations of the building's mechanical equipment.

**Table 3 – Boiler Efficiency**

Boiler	Net MBH Output	Gross MBH Input	Efficiency	Complaint
B-1	5,880	7,000	84%	Yes
B-2	5,880	7,000	84%	Yes

**Table 4 - Split System Air Conditioning Unit**

Unit	SEER	Complaint
AC-1	10.5	Yes

**Table 5 – Air Handler Efficiency**

Air Handler	Air Flow (cfm)	CFM*0.0015	Fan HP	Complaint
AHU-1	15,850	23.8	25	No

EF-17	3,375	3.71	1.5	Yes
EF-18	770	0.85	0.25	Yes
EF-19	3,750	4.13	2.0	Yes
EF-20	3,750	4.13	2.0	Yes
EF-21	3,750	4.13	2.0	Yes
EF-22	105	0.12	0.07	Yes
EF-23	300	0.33	0.19	Yes
EF-24	75	0.08	0.07	Yes
EF-25	75	0.08	0.07	Yes
EF-26	200	0.22	0.06	Yes
EF-27	1,275	1.40	0.25	Yes
EF-28	125	0.14	0.02	Yes

While most the equipment complies with the 2007 standard the majority of the air handlers do not. They, however, did comply with the 2004 edition which was the standard used when the system was designed.

### *Service Water Heater*

The two boilers are in compliance with this section, boilers are required to have efficiency greater than 78% and as already shown in Table 3 the boilers in this system are rated at 84%.

### *Lighting*

Due to the size and number of rooms within in the school the building area method was used to calculate the power density for each area of the building. Table - 8 shows the areas that were used to divide up the school.

**Table 8 – Lighting Density**

<b>Space</b>	<b>Area (ft<sup>2</sup>)</b>	<b>Actual Watts</b>	<b>Allowable Watts</b>	<b>Complaint</b>
School	144,662	116,349	173,594	Yes
Gym	26,755	34,153	29,430	No
Office	6,186	6,508	6,186	No
Theater	10,720	5,166	17,152	Yes
Library	3,490	1,806	4,537	Yes
Cafeteria	13,620	8,784	19,068	Yes

The building complies with the overall lighting density but as the table above shows that the office and gym do not meet 90.1 requirements.

## Appendix B Outdoor Air Calculation

---

Outdoor Air Calculation for a typical classroom served by air handler 7 with a primary airflow of 1,280

**Step 1** Determine  $A_z$  and  $P_z$ :  $A_z = 802 \text{ ft}^2$ ,  $P_z = 25$  occupants

**Step 2** Calculate  $V_{bz}$ : From table 6-1  $R_a = 0.12 \text{ cfm/ft}^2$  and  $R_z = 5 \text{ cfm/occupants}$

$$V_{bz} = 802 * 0.12 + 25 * 10 = 345 \text{ cfm}$$

**Step 3** Determine  $E_z$  from table 6-2:  $E_z = 1.0$

**Step 4** Determine  $V_{oz}$ :

$$V_{oz} = 345 / 1.0 = 345 \text{ cfm}$$

**Step 5** Determine  $Z_p$ :

$$Z_p = 345 / 1,280 = 0.27$$

**Step 6** Determine  $E_v$  from Table 6-3:  $E_v = 0.8$

**Step 7** Determine  $V_{ou}$ :

$$V_{ou} = 4,525 \text{ cfm}$$

**Step 8** Calculate  $V_{ot}$ :

$$V_{ot} = 4,525/0.8 = 5,655 \text{ cfm}$$

## Appendix C Outdoor Air Calculation

---

Outdoor air calculation for a zone with a  $Z_p$  value greater than 0.55, the space is a waiting room classified as reception served by Air Handler 10 with a  $V_{pz} = 100 \text{ cfm}$

**Step 1** Determine  $A_z$  and  $P_z$ :  $A_z = 370 \text{ ft}^2$ ,  $P_z = 14$  occupants

**Step 2** Calculate  $V_{bz}$ : From table 6-1  $R_a = 0.06 \text{ cfm/ft}^2$  and  $R_p = 5 \text{ cfm/occupants}$

$$V_{bz} = 370*0.06+14*5 = 50 \text{ cfm}$$

**Step 3** Determine  $E_z$  from table 6-2:  $E_z = 0.8$  – This is because the air supplied to this space is  $15^\circ\text{F}$  greater than designed temperature.

**Step 4** Determine  $V_{oz}$ :

$$V_{oz} = 50/0.8 = 65 \text{ cfm}$$

**Step 5** Determine  $Z_p$ :

$$Z_p = 345/1,280 = 0.27$$

**Step 6a** Determine  $X_s$ :

$$X_s = 1,670/8,565 = 0.19$$

**Step 7a** Determine  $V_{dz}$ :  $V_{dz} = 100 \text{ cfm}$

**Step 8a** Determine  $Z_d$ :

$$Z_d = 65/100 = 0.65$$

**Step 9a** Determine  $E_{vz}$ :

$$E_{vz} = 1 + 0.19 - 0.65 = 0.54$$

**Step 10** Determine  $V_{ou}$ :

$$V_{ou} = 1,670 \text{ cfm}$$

**Step 11** Determine  $V_{ot}$ :

$$V_{ot} = 1,670/0.54 = 3,090 \text{ cfm}$$
