Executive Summary

The purpose of this report is to determine if the Virtua Replacement Hospital complies with the ASHRAE Std 62.1 and Std 90.1. The Virtua Replacement Hospital is currently under construction and is located in Voorhees, NJ. It is comprised of two main buildings, a patient room tower, and a ancillary building where the surgery and emergency rooms are located. Due to the occupancy of the building, it was very important that the building conformed to the code.

The ASHRAE Standard 62.1-2007 analysis showed that the building is compliant for the most part. The building complied with almost every code in Section 5, and it showed that high quality indoor air was a key design feature in the design of the HVAC system. The calculations from Section 6 further proved this by the high outdoor air rates. The calculated rates differed from the design rates, however. This is because the ASHRAE codes were not used in the original design. Instead IMC 2003 and AIA 2001 were used to calculate outdoor air rates.

The hospital also complied with most of ASHRAE Std 90.1-2007. The equipment being used was all compliant, except for the supply fans. This was due to the use of the building requiring high indoor air quality, thus requiring better filters. The chillers and boilers were also well above the minimum efficiencies. The building does use a large amount of glass; however, it is a specialized Low e glass. The walls and roofs surpassed the minimum values, making the exterior envelope of the building well above the standard. The large amount of glass was also able to save on the amount of lighting used. The lighting density was well below the max value specified in Section 9 due to the large amount of natural day light.

While this building was not going after a LEED certification, reducing the amount of energy use was a major factor. This was especially important due to the fact that it is a hospital, and the energy use will be significant. The hospital was able to diminish the energy use by efficient equipment, and the use of natural day lighting to eliminate the use of artificial light.

System Description

The hospital consists of three 1,000 ton centrifugal chillers located in the central utility plant behind the ancillary portion of the building. Located on the roof of the building are three 9,000 gpm high efficiency cooling towers.

The hospital utilizes a VAV (Variable Air Volume) system throughout the building. There are three sets of AHU's located on the 7th floor. The first set consists of two AHU's at 50,000 cfm each. This will serve dietary areas and labs. The second set of AHU's also consists of two sets of 50,000 cfm AHU's. These will serve emergency and surgery rooms. The last set consists of six 75,000 cfm units that will serve the 8 story patient bedroom tower. For the computer room there are three computer room air conditioning units (CRAC).

For heating and humidifying the hospital has four steam boilers. Two of the boilers are 40 BHP, while the other two are 287 BHP. All four are located in the central utility plant. Coupled with the boilers are six shell and tube heat exchangers located in various areas around the building used for hot water heating.

ASHRAE Std 62. 1

Section 5

Section 5.1 Natural Ventilation

There is no natural ventilation being used in the building, and there are no operable windows as well so section 5.1 does not apply.

Section 5.2 Ventilation Air Distribution

All the spaces in the building meet the ventilation requirements. Since a VAV system is utilized throughout the building the dampers are set not to go past a certain angle as to allow no less than minimum ventilation.

Section 5.3 Exhaust Duct Location

All exhaust fans from surgery, patient rooms, kitchens, and other exhausted areas are ducted directly to the roof. They are all negatively pressured as to not allow any contaminants to spread throughout occupied spaces. Figure 1.1 shows a typical assembly for the exhaust located on the roof. This particular exhaust is for a kitchen hood, and contains a drip pan to catch any grease or contaminants.

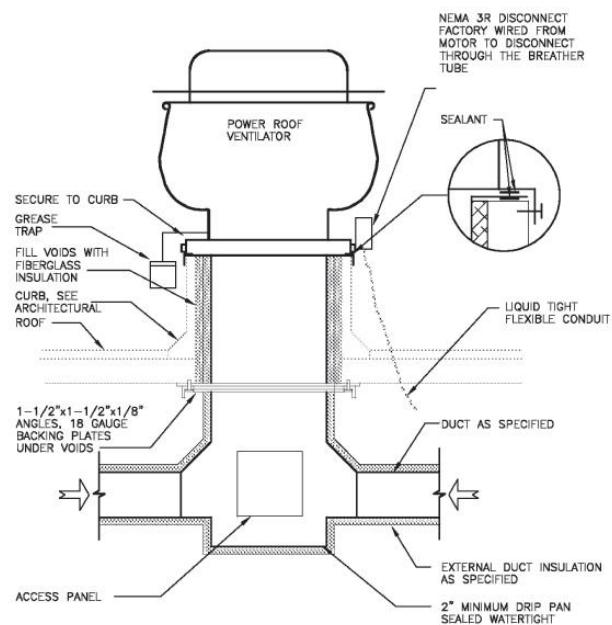

Figure 1.1 Typical Exhaust

Section 5.4 Ventilation System Controls

All boilers are controlled by a BAS (Building Automation System) that provides header pressure control. The BAS system is also integrated into the chillers. They are programmed to always be on, but can be adjusted by the user for a certain time table for the mechanical room. The return and exhaust ducts shall be controlled to maintain a constant negative shaft pressure. All 3 AHU sets will be controlled by a separate dedicated direct digital controller.

Section 5.5 Airstream Surfaces

All surfaces and materials in the ducts and mechanical equipment have been tested under ASTM C1338 and UL 181, among other ASTM tests. All materials in contact with the airstream are resistant to mold growth and erosion.

Section 5.6 Outdoor Air Intakes

All outdoor air intakes are well over the minimum distance from any contaminated exhaust, loading area, or garbage area. However, the boiler exhaust flues are directly next to the cooling towers allowing possible contamination of the chilled water, which can be seen in Figure 1.2. There are two boiler exhaust flues within a couple feet of a cooling tower, which is not compliant.

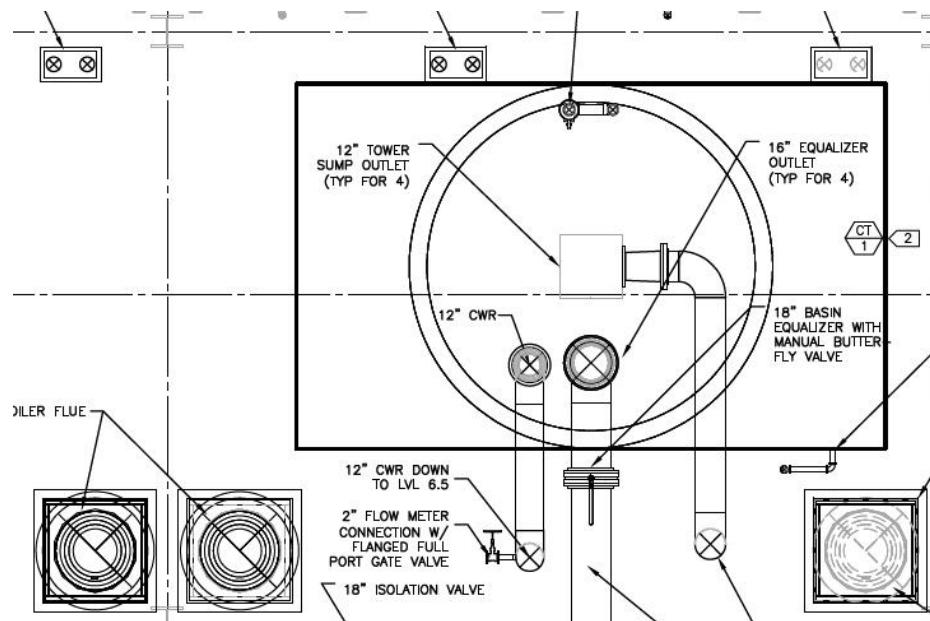

Figure 1.2 Cooling Tower/Exhaust Relation

Section 5.7 Load Capture of Contaminants

All exhaust systems exit directly to the roof of the building, allowing no contaminants back inside of the building or mechanical system. Figure 1.3 shows the two direct exhaust ducts that are connected directly to the generators that go directly

to the roof for immediate extraction. Figure 1.4 shows the exhaust ducts for the mechanical room. Seen here is the exhaust ducts for the chillers and boilers. It also shows the location of exhaust ducts for future additions.

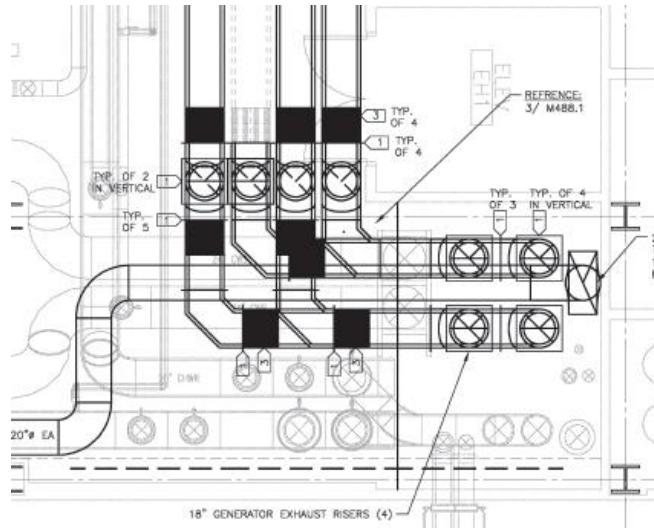

Figure 1.3 Generators Direct Exhaust

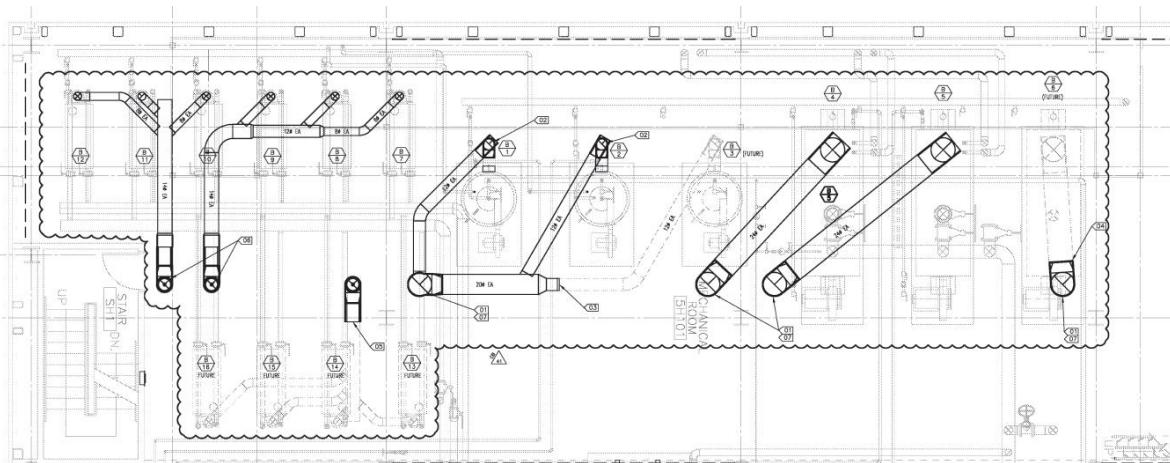

Figure 1.4 Mechanical Room Direct Exhaust

Section 5.8 Combustion Air

Combustion air from the generators, boilers, and heaters are all directly exhausted outdoors allowing no contamination inside the building.

Section 5.9 Particulate Matter Removal

The minimum rating in the building is an 8 MERV rating for public places and corridors. 13 to 17 MERV filters are used for surgery, patient, and lab rooms. Table 1.1 shows the types of filters that are used in the AHU units. AHU sets 1 and 2 both serve areas where the supply air needs to be cleaner, which is why they have the 13 MERV and 17 MERV filters.

TAG	LOCATION	TOTAL CFM		
			TYPE	MERV
AF1A-1	AHU-1A	50,000		13
AF1B-1	AHU-1B	50,000		13
AF2A-1	AHU-2A	50,000		13
AF2A-2		50,000		17
AF2B-1	AHU-2B	50,000		8
AF2B-2		50,000		17
AF3A-1	AHU-3A	75,000		8
AF3A-2		75,000		14
AF3B-1	AHU-3B	75,000		8
AF3B-2		75,000		14
AF3C-1	AHU-3C	75,000		8
AF3C-2		75,000		14
AF3D-1	AHU-3D	75,000		8
AF3D-2		75,000		14
AF3E-1	AHU-3E	75,000		8
AF3E-2		75,000		14
AF3F-1	AHU-3F	75,000		8
AF3F-2		75,000		14

Table 1.1 AHU Filter Ratings

Section 5.10 Dehumidification Systems

No space inside the building exceeds the 65% relative humidity. The overall pressure of the building is positive except for certain spaces such as surgery rooms, and toilets which constantly maintain a negative pressure.

Section 5.11 Drain Pans

Drain pans are sloped stainless steel pans located directly under the cooling coils in order to collect condensation. A drain is located on the bottom end of the pan for proper drainage to prevent mold growth around the coil. Figure 1.5 shows the location of the drain pan directly underneath the cooling coil in a typical AHU unit.

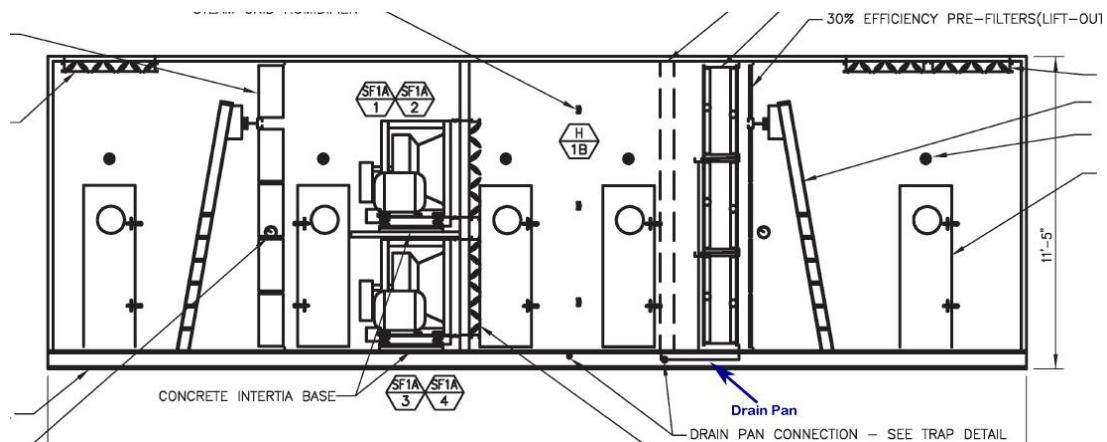

Figure 1.5 Drain Pan Location

Section 5.12 Finned-tube Coils and Heat Exchangers

There are no finned tube coil heat exchangers located in the building located in the building so this section does not apply. The ones used in this building are shell and tube, and plate and frame.

Section 5.13 Humidifiers and Water-Spray Systems

All water originates from an offsite source and goes through a filtration process within the hospital.

Section 5.14 Access for Inspection, Cleaning, and Maintenance

Boilers and chillers located in large open floors for ease of access all around the equipment and pipes. AHU's are located on an accessible floor, and have 2 rolling maintenance ladders leading into each end for easy maintenance. Figure 1.6 shows the two rolling ladders that are located on each end. These allow for maintenance to the unit as well as the ability to easily change the filters.

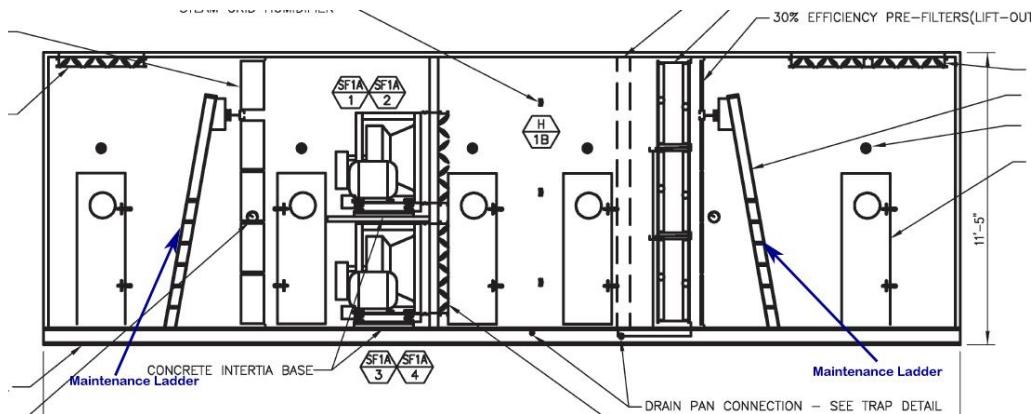

Figure 1.6 Maintenance Ladder Locations

Section 5.15 Building Envelope and Interior Surfaces

Elastomeric sheet water proofing is used on walls located below grade for water protection. Hot fluid applied rubberized asphalt waterproofing is used on concrete horizontal surfaces such as slabs on grade. Interior walls of the building have a polyethylene vapor retarder with a max .13 perm. Elastomeric wall membrane moisture barriers are used on the exterior walls as well as the joints for moisture protection.

Section 5.16 Buildings with Attached Parking Garages

There is no attached parking garage so this section does not apply.

Section 5.17 Air Classification and Recirculation

The buildings return air is classified as class 1 for public areas such as the lobby and corridor spaces. Exhaust air from the kitchens and surgery rooms are at least class 3 and are exhausted directly to the roof. Toilets are class 2 and are also directed to the roof.

Section 5.18 Requirements for Buildings Containing ETS Areas and ETS-Free Areas

The building is a non-smoking building and smoking areas are located away from any entrance so indoor air quality is not affected by this.

Section 6

An analysis of all three sets of AHU's was done using the ASHRAE Std 62.1 Section 6 guidelines.

Ventilation Rate Procedure

Breathing Zone Outdoor Airflow (V_{bz})

$$V_{bz} = R_p \times P_z + R_a \times A_z \text{ (Eq. 6-1)}$$

A_z = zone floor area (ft^2)

P_z = zone population

R_p = outdoor airflow rate per person (cfm/person)

R_a = Outdoor airflow rate per unit area (cfm/ ft^2)

Zone Outdoor Airflow (V_{oz})

$$Z_p = V_{oz}/V_{pz} \text{ (Eq. 6-5)}$$

- For VAV Systems, V_{pz} is the minimum expected primary airflow for design purposes.

System Ventilation Efficiency (E_v)

E_v is found by using the Maximum Z_p value (Table 6-3)

Uncorrected Outdoor Air Intake (V_{ou})

$$V_{ou} = D \sum_{\text{all zones}} (R_p \times P_z) + \sum_{\text{all zones}} (R_a \times A_z) \text{ (Eq. 6-6)}$$

D = Diversity = $P_s / \sum_{\text{all zones}} (P_z)$ (Eq. 6-7)

P_s = system population, total population in the area served by the system

Outdoor Air Intake (V_{ot})

$$V_{ot} = V_{out}/E_v \text{ (Eq. 6-8)}$$

Outdoor Air Flow Calculation Assumptions

While analyzing the different spaces for Section 6, it was necessary to make certain assumptions for many of the areas listed. I considered all passages and alcoves as corridors when calculating outdoor air requirements. All spaces labeled HSKG are essentially storage spaces for gloves and lab coats, so these were treated as normal storage units.

Since the building is a hospital, there are many specialized rooms used for different types of surgeries and procedures. ASHRAE does not have values for these types of spaces, so values for R_p were based on the International Mechanical Code (IMC) 2003. Both IMC 2003 and AIA 2001 were the codes that were used on the design of the HVAC system in this hospital. Many of the surgery and clean procedure rooms required a minimum of 15 cfm/person based on these codes.

Std 62.1 Findings

The HVAC design of the hospital meets all of the requirements in Section 5 of Std 62.1, except for location of the cooling towers relative to the exhaust flues for the boilers. This is odd because there is a major effort to not let any contaminants in the air into the indoor spaces. This is done through making sure the outdoor air intakes are located well away from any exhaust ducts. Since the building is located in the middle of a 120 acre site, any pollutants from an exterior source will not reach the intakes. A minimum of 8MERV filters are used, with a minimum of 13 MERV used for spaces requiring very clean air. However, due to the location of the boiler exhausts, it is possible that contamination can still happen through the cooling towers.

Calculations were performed for each room in Section 6 to determine the minimum outdoor airflow requirements based on ASHRAE standards. The outdoor air fraction (Z_p) for each space was calculated based on the calculated outdoor airflow requirements and the design supply air. Next the overall system Z_p was calculated along with the total amount of airflow that the systems will need to produce. These values for each space in the hospital can be seen in the spreadsheet in Appendix A.

The AHU systems for the hospital are broken down into 3 main sets of AHU's. AHU Set 1 consists of two AHU units, manufactured by Haakon, that each produces 50,000 cfm. Table 1.1 below shows the larger Z_p values for the spaces served by AHU 1A and 1B.

Max Z _p AHU-1 Values	
Room Type	Z _p
Dining	45.60%
Conference	25.70%
Library	34.70%
Record Storage	22%
Main Lab	31%
Classroom	46.70%
Microbiology	31.10%
ControlRm	18.90%

Table 2.1 Max Z_p Values for Spaces in AHU Set 1

The max Z_p for AHU Set 1 is the classroom and dining area. The dining area has a large Z_p due to its function, as well as the large amount of people that will be in the space. The classrooms high Z_p can be attributed to the fact that the required rates for a classroom are high, and the design supply airflow is low compared to the calculated outdoor air flow. The library has a large fraction of outdoor air as well; this can be attributed to the fact that libraries require more outdoor air so that mold does not collect on the books. The same could be said for the record storage room, since this houses many of the patient records. The main lab and the microbiology room both have a large Z_p, but this is expected since they are labs and a large outdoor air intake is a must.

Max Z _p AHU-2 Values	
Room Type	Z _p
Radiation	22.30%
CT Control Room	52.80%
Triage	22.30%
Major Med	20.60%
OR 3,5,6	100%
OR 2	48.30%
OR 1	73.30%
OR 7	42.30%
OR 4	27.90%
Future OR	42.70%

PACU OP	19.30%
Workroom/Lounge	15-20%
Patient	32%

Table 2.2 Max Z_p Values for Spaces in AHU Set 2

Table 2.2 shows the max Z_p values for AHU Set 2. This set is the same as AHU Set 1, it contains two Haakon units that each produce 50,000 cfm. The rooms with the highest Z_p are the operating rooms. They each differ in Z_p due to the difference in size, and design supply air. Three of the operating rooms are 100% outdoor air. The four remaining operating rooms do have a mix of return air in the supply air. However, there is still a very high Z_p for these rooms, with 73% being the next highest. The triage, major med, and radiation rooms also have a high Z_p since they also require a lot of outdoor air. The workrooms and lounges also have a higher Z_p due to the fact that each space has a high occupant density.

Max Z _p AHU-3 Values	
Room Type	Zp
Conference	17-20%
Meditation	38.90%
Chute Rm	28.60%
Family Waiting	20.60%
Triage	21.80%
Ultrasound	24%
Major Med	24.60%
Basement Nursery	25%
Cardio Reading	18%
Flouro	26%
OB On Call	27%
Surgery Training	32%
LDR	32%
PREP	23%
Patient	26%
Recovery	31%
Special Infant Room	26%

Table 2.3 Max Z_p Values for Spaces in AHU Set 3

Table 2.3 shows the max Z_p values for AHU Set 3. This particular set supplies a much larger area than the previous two. This set contains six AHU units that provide 75,000 cfm each. The max Z_p level for this set is the meditation room. This is because it numerous people and was modeled after an aerobics room in the ASHRAE Table 6-1 table. Much like AHU Set 2, there are a couple spaces that require more outdoor air than normal since they are surgery/clean rooms. These include the triage, major med, ultrasound, and the prep room. All of these values are around 25%. Like the family waiting rooms, the conference rooms also require a larger fraction of outdoor air due to the large population that it is designed for. The Z_p of the patient rooms is also important to note. There are 313 patient rooms on this AHU set, and each patient room has a Z_p of 25–31%, depending on the size and function. These are high because patient comfort and health are a major factor for the design of the hospital. An increase in outdoor air will make the air cleaner and fresher for the patients.

Std 62.1 Conclusion

AHU Unit Conclusion					
	Overall System Z_p	Max Z_p^*	E_v	V_{ou}	V_{ot}
AHU-1	17.1%	46.0%	0.69	16706	24211.6
AHU-2	24.0%	32.0%	0.82	21211	25867.1
AHU-3	29.0%	32.0%	0.82	69839	85169.5

* May not be highest Z_p value for each zone

Table 2.4 AHU System Values

Table 2.4 above shows the final values for all three AHU sets. It is important to note that the actual highest value of Z_p was not chosen. This is due to the fact that the hospital has specialty rooms that require a large amount of outdoor air. Choosing the absolute highest Z_p would be misleading in terms of figuring out the overall system efficiency. For example, AHU Set 2 has operating rooms that have a 100% Z_p and a 73% Z_p . These are only a couple rooms out of 500, and once again are specialty rooms. The E_v of AHU Set 2 and 3 are both high due to the lower max Z_p values. Both these values were for the patient rooms. Finally the final V_{ot} was calculated for each system.

The design supply air does not include the design outdoor air in the room schedules. When adding the V_{ot} to the supply air for AHU Set 1, the total value was 122,091 cfm. This is important to note because AHU Set 1 can only produce 100,000 cfms, meaning that by AHSRAE standards this system is undersized. This could be because ASHRAE codes were not used in the analysis in this building. Instead IMC 2003 and AIA 2001 were used to determine ventilation rates. AHU Set 2 has the same problem; it is undersized by about 16000 cfm when using ASHRAE standards. AHU Set 3 is actually oversized. It can produce a total of 450,000 cfms; meanwhile only 325,749 cfms are required. There is a reason for this however. Almost all of the hospitals mechanical equipment is designed to have additions in the future. There are plans to add an additional chiller and boilers. The same is being done for additional spaces in the building. AHU Set 3 was designed to be able to handle the additional cooling and heating loads that will occur when new additions are put in place.

Values for all of the spaces can be seen in Appendix A at the end of the tech report. When looking at the Z_p value it is important to note that the design supply air does not include outdoor air. For this reason I added the calculated outdoor air to the supply air when calculating Z_p , making the equation $V_{bz} / (V_{bz} + SA)$. For this reason many of the spaces may have a 100% outdoor air fraction due to the fact that ASHRAE requires outdoor air in these spaces, but the design calls for no supply air.

ASHRAE Std 90.1

Section 5

The Virtua Replacement Hospital is located in Voorhees NJ, which is in climate zone 4A as seen in the ASHRAE Table B1.

As seen in Table 2.1 the vertical fenestration is over the limit set by ASHRAE. However, it is only over by 3%, and the type of glass used has a U-Value that is well below the max. For this reason it was decided that the Prescriptive Building Envelope Compliance Path was an acceptable path to follow.

As seen in Table 2.1 the building envelope complies with all of the standards of Section 5.4. Roof type 1 is the standard roof used on the hospital and it does meet the minimum R-Value. Roof type 2 is a green roof. The construction is the same as Roof Type 1, except it has an additional soil barrier and 4" of soil, thus giving it a higher overall R-Value.

Figure 2.1(Wall Type 1) and 2.2 (Wall Type 2) show the two main exterior wall constructions used in the building. Wall Type 1 consists of stone veneer panels, while Wall Type 2 consists of composite metal panels. As seen in Table 2.1 below, both comply with code.

The exterior envelope of the hospital consists of a large amount of glass as seen by the fenestration percentage. Many types of glass are used throughout the building, but there are three main types that were analyzed. Curtain Wall 1 consists of a clear Low e glass $\frac{1}{4}$ " panel, followed by a $\frac{1}{2}$ " air space, and then another $\frac{1}{4}$ " Low e panel for a total U-Value of 0.29. Curtain Wall 2 is a clear heat strengthened $\frac{1}{4}$ " panel, with a $\frac{1}{2}$ " air space, followed by another $\frac{1}{4}$ " heat strengthened panel for a total U-Value of 0.29. Wall Type 3 consists of a silk screened Low e $\frac{1}{4}$ " panel, $\frac{1}{2}$ " airspace, followed by another $\frac{1}{4}$ " Low e panel for a total U-Value of 0.26. All of these values are well below the max U-Value, so the large amount of glass shouldn't be a problem.

Value	Minimum Roof R-Value		Minimum Wall R-Value		Fenestration Max U-value			% Fenestration	Fenestration Max SHGC
Required	R-20		R-9.5		U-0.40			40%	0.4
	<i>Roof Type 1</i>	<i>Roof Type 2</i>	<i>Wall Type 1</i>	<i>Wall Type 2</i>	<i>Curtain Wall 1</i>	<i>Curtain Wall 2</i>	<i>Curtain Wall 3</i>	$111530/256908 \text{ ft}^2$	
Designed	R-23	R-28	R-14	R-27	U-0.29	U-.29	U-.26	43%	0.3
Compliance	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes

Table 2.1 Exterior Envelope Analysis

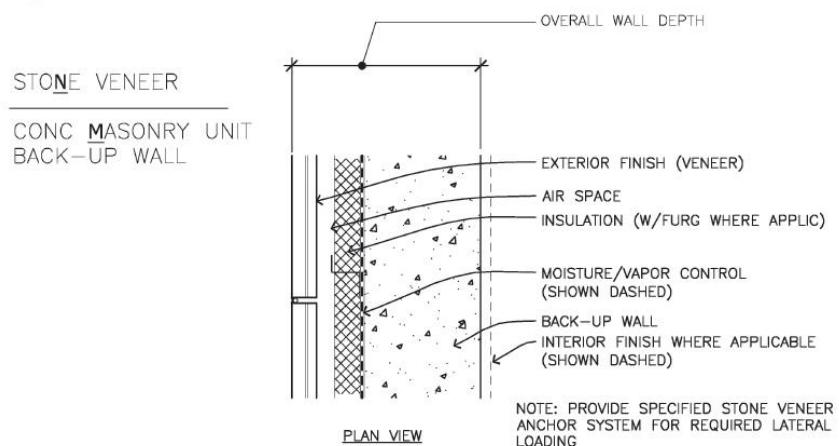

Figure 1.1 Wall Type 1

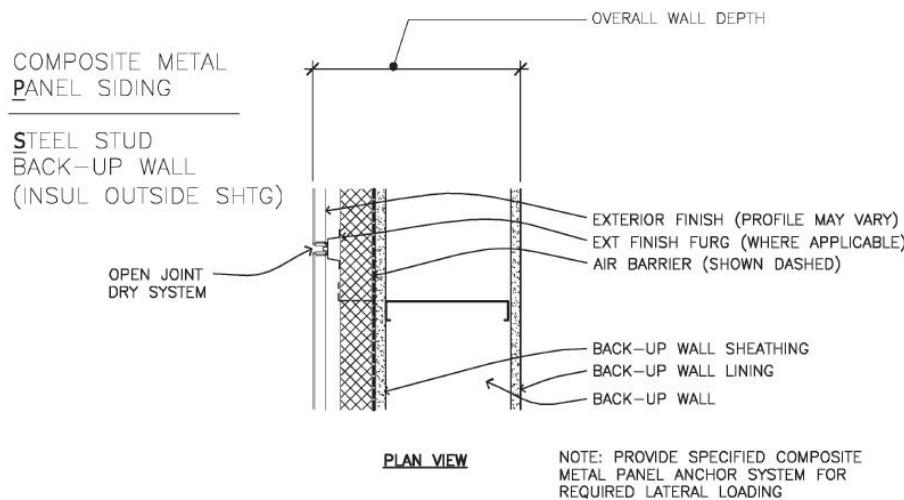

Figure 1.2 Wall Type 2

Section 6

Section 6.2 Compliance Path

The Mandatory Provisions and Prescriptive Path shall be used for this analysis due to the large size of the building.

Section 6.4 Mandatory Provisions

Thermostatic controls will control the supply of heating and cooling energy that reaches each zone. The thermostats used will be very accurate with an accuracy of $\pm 1^\circ \text{F}$. Since this is a hospital and many spaces are used 24/7 there is not a scheduled stop and start time for the system. For spaces that do run 24/7, there are occupancy sensors that are capable of shutting the supply air off when no one is in the room for a certain amount of time. The heating controls will have the option to automatically restart and operate the system to maintain zone temperatures above a heating set point down to 55°F.

All exhaust ducts are equipped with dampers that will allow them to be shut when not in use. The maximum damper leakage is 1 cfm/ft² which is well below the maximum damper leakage.

Section 6.5 Prescriptive Path

Table 2.2 shows the Fan Power Limitation for the supply air fans. As seen below none of the supply fans comply with this standard. This is likely due to the extra pressure drops due to the higher rated filters. Many of the filters are 13, 14, and 17 MERV filters so the supply fan motors must be more powerful to accommodate the increase in pressure.

Supply Fan Compliance

Table 2.4 Exhaust Fan Compliance

Section 6.7 Submittals

All systems are to be tested to ensure that the controls are calibrated and are in working order.

Section 6.8 Minimum Equipment Efficiency Tables

All systems were analyzed based on the tables in Section 6.8. As seen in Table 2.5, all three centrifugal chillers are compliant. The COP and NPLV were calculated based on the full load and part load KW/Ton values.

Chiller Schedule								
Tag	Cooling Capacity	Type	Full Load KW/Ton	Part Load KW/Ton	Minimum COP	Minimum NPLV	Actual COP	Actual NPLV
CH-1	1000 TON	CENTRIFUGE	0.611	0.501	5.6	6	5.8	7
CH-2	1000 TON	CENTRIFUGE	0.611	0.501	5.6	6	5.8	7
CH-3	1000 TON	CENTRIFUGE	0.611	0.501	5.6	6	5.8	7

Table 2.5 Chiller Compliance

Table 2.6 shows that all four steam boilers are compliant with the standards. The multi-port boilers surpass the minimum efficiency; meanwhile the flex tube boilers just meet the requirements. All four boilers run on natural gas.

Steam Boiler Schedule						
Tag	Type	Capacity (BTU/hr)	Fuel	Minimum Efficiency	Boiler Efficiency	Compliance
B-1	MULTI PORT	1,340,000	NG	75	80	Yes
B-2	MULTI PORT	1,340,000	NG	75	80	Yes
B-4	FLEXTUBE	9,614,500	NG	80	80	Yes
B-5	FLEXTUBE	9,614,500	NG	80	80	Yes

Table 2.6 Boiler Compliance

Table 2.7 shows that the cooling towers are also well above the required minimum requirements specified in Section 6.8.

Cooling Tower Compliance					
Tag	Fan Motor HP	Required Minimum GPM	Required Minimum GPM	Flow	Compliance
CT-1	120	20 gpm/hp	2400	9000	Yes
CT-2	120	21 gpm/hp	2400	9000	Yes
CT-3	120	22 gpm/hp	2400	9000	Yes

Table 2.7 Cooling Tower Compliance

The final system analyzed was the condensing boilers. As seen in Table 2.8 they all comply with the standard.

Condensing Boiler							
Tag	Capacity (BTU/hr)	HP	Max Flow	Fuel	Required Minimum Efficiency	Boiler Efficiency	Compliance
B-7	2780000	87	350	NG	82%	87%	Yes
B-8	2780000	87	350	NG	82%	87%	Yes
B-9	2780000	87	350	NG	82%	87%	Yes
B-10	2780000	87	350	NG	82%	87%	Yes
B-11	2780000	87	350	NG	82%	87%	Yes
B-12	2780000	87	350	NG	82%	87%	Yes

Table 2.8 Condensing Boiler Compliance

Section 7

Domestic Hot Water is supplied by three shell and tube 10,041 MBH heat exchangers, as well as the steam boilers. Each heat exchanger has an efficiency of 88%, which is well above the 80% required.

Section 9

The method used to calculate the lighting density was to find the total wattage serving the lights and then divide it by the square footage. Table 3.1 shows the fixtures used in the building along with the wattage of each one. According to Section 9 Table 9.5.1 there should be no more than 1.2 W/ft² for a hospital. This hospital has a .6 W/ft² for lighting. This is well below the limit for hospital. The reason for this is not only the use of energy efficient lights, but because of the significant use of daylight. The patient rooms all utilize a significant amount of daylight and because of this the amount of light needed is greatly diminished.

Wattage				
Tag	#	Type	W	Total W
DF1	743	6" FLO	44	32692
MF2	409	2X4 FLO	93	38037

TOTAL				387649

Table 3.1 Lighting Power Density

Std 90.1 Conclusion

The building complies with Std 90.1 for the most part. The chillers, boilers, and cooling towers are all above the required efficiencies. All of the supply fans did not comply, however this is most likely due to the increase in pressure due to the filters being used. The remaining exhaust and return fans all did comply with code except for one exhaust fan.

The building does an exceptional job with its exterior envelope, especially considering the amount of glass that is being used. The glass U-Values were well

below the max, and the R-Values were all much higher than required. The lighting density was also very good. It was well below the max value for a hospital. This is definitely due to the fact that the hospital makes great use of natural day lighting.
