Thesis Objectives

Project Goals

- **Improve Lateral Framing System**
- **Decrease the weight of the building**
- **Reduce the cost and schedule of the framing system**
- **Minimize the impact on the architecture**

Structural Depth

- Originally an ordinary concrete moment frame with post tensioned slab
- Irregular column layout

Proposal

- In corporation of a shear wall system
- Reduction in column sizes throughout building

Thesis Objectives

Project Goals

- **Improve Lateral Framing System**
- **Decrease the weight of the building**
- **Reduce the cost and schedule of the framing system**
- **Minimize the impact on the architecture**

Architectural Breadth

- Redesign column layout
- Modification of floor plan and façade elements

Cost and Scheduling Breadth

- Compare validity of existing and alternative structural systems

About Falls Church Tower**Thesis Objectives****Depth Study**

Alternative Lateral Framing System

Breadth #1

Architectural Impact

Breadth #2

Cost and Schedule Analysis

Conclusion**Acknowledgements****Depth Study****Existing Gravity System**

- 7" thick post-tensioned slab
- 2-3 strand tendons
- Tendons spaced 5' on center
- Irregular array of columns
- Range of sizes
- Typical 25'x25' bays

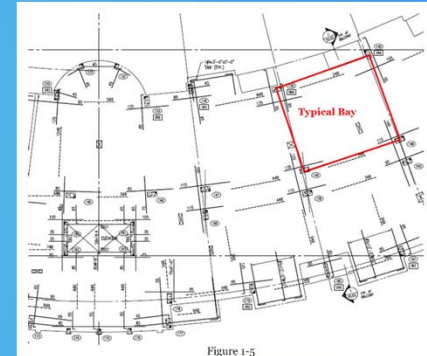

Figure 1-5

Alternative Lateral Framing System

Breadth #1

Architectural Impact

Breadth #2

Cost and Schedule Analysis

Conclusion

Acknowledgements

Depth Study

Existing Lateral System

- Columns uniquely oriented to reduce lateral displacement in both directions
- Range in column sizes meant to resist lateral loads as much as gravity loads

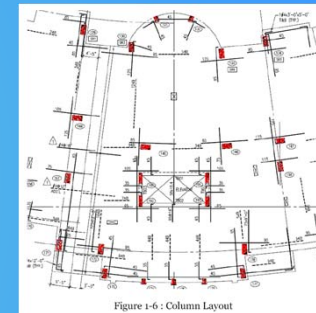

Figure 1-6 : Column Layout

Depth Study

ETABS Model

- **Originally modeled in AutoCAD**
- **Transferred to ETABS**
- **Diaphragms were assumed to be rigid**
- **All seismic forces were applied at center of mass**
- **All column were fixed at both ends**

Depth Study

Column Design

- Sized columns based on the new layout
- Tributary areas determined in AutoCAD
- 3 typical column types
 - Interior Column
 - “Large Area” Interior Column
 - Exterior

Depth Study

Shear Wall Design

- Layout 5 was modeled in ETABS
- New seismic load was determined
- Analysis was run to determine the stresses in the shear wall
- Strength checks were performed and the wall strength verified

Cost and Scheduling

Goals

- **Develop estimates for both the existing structure and the revised structure**
- **Develop scheduling estimates for both the existing structure and the revised structure**
- **Compare the cost and schedule estimates and verify the feasibility of the revised structure**

Cost and Scheduling

Cost and Scheduling Process

- Determine necessary criteria
- Materials, formwork, steel, etc.
- Find unit prices/hours using RS Means Costworks

	Structural
	• Reduce Size
	• Incorporate shear walls and reduce lateral drift
	Architecture
	• Reduce the number of columns and assign to grid with minimal impact on the floor plan
	Cost and Scheduling
	• Use cost estimates to verify the feasibility of the shear wall system
