Technical Assignment 2

Construction
Option

Advisor: Dr Ed
Gannon

October 16th 2013

Executive Summary

The following report details the new construction commercial high rise project and the construction techniques employed to build it. The exact project location and name is to be held confidential but it can be known that the project is located in a major US city. In this technical assignment the following will be discussed

- Detailed Project Schedule
- Detailed Structural Estimate & Assemblies MEP Estimates
- General Conditions Estimate
- Site Layout Planning
- Constructability Challenges
- LEED Evaluation

Figure 1: Image courtesy of Hines

The detailed project schedule breaks down the scope of the work by trade and provides enough detail that the sequencing of the work can be understood. The project start date is set at December 24th 2012 and is scheduled for substantial completion on March 3rd 2015. This is roughly a 26 month project duration or 600 working days. Each trade begins approximately two months apart from each other per floor. In other words the concrete core, steel, superstructure, SOFP, Envelope, and core-fit-out start dates are all two months apart. This is mainly the reason why the project duration is 26 months.

The detailed structural systems estimate was calculated for floors with similar layouts and was extrapolated for the entire building. Two separate takeoffs for concrete and steel were completed. It was found that the structural steel system will cost \$14,088,458.30, which is a \$32.60 per square foot. This is slightly lower than the \$45.22 per square foot for the steel system. This can be because of the variability of the steel system. The same can be said for the concrete as a total cost was estimated to be \$20,553,271.01 which is \$47.54 per square foot and the actual is \$43.28 per square foot.

The assemblies estimate was calculated for the MEP system of the building. Various systems were unaccounted for many each of the systems due to the complexity of the systems used. Pricing for these assemblies was not found in RS Means and left out of the estimate.

The general conditions estimate for the project came out to be \$15,661,621.33 for the project. This is roughly \$602,370.05 per month. The most costly section was the insurance and bonding, followed by the personnel, and then the miscellaneous costs. This estimate was relatively close to the original estimate of \$18.7M.

Site layout plans were completed for three phases; excavation, superstructure, and building envelope. Various features change throughout each plan, but a similar layout was adopted as Turners due to site constraints of the project.

Three Constructability Challenges have arisen from the downtown site location and the constraints that come along with them. Some of these issues included the excavation, installation of utility lines, and public safety.

Finally, a LEED evaluation was done using the latest scorecard for Core & Shell. A approach similar to the Penn State method was used and then compared to the approach the project team used.

Detailed Project Schedule

The detailed project schedule for The Tower was made using Primavera P6 scheduling and can be found in Appendix A. The project is in the middle of construction the concrete core and metro station with structural steel to begin on November 20th 2013. This detailed schedule breaks down the scope of the work by trade and details the work that will be performed by those different trades. The schedule consists of 200 activities and milestones that starts with the GMP preparation and finishes with the final completion. The project start date is December 12th, 2012, and is scheduled to finish on May 29th 2015. This is roughly twenty six months or 600 working days. The level of detail in this schedule allows for the sequencing of work to be understood without being too excessive in detail. The detailed schedule is organized by the different major trades / activities such as excavation and foundation, concrete core, structural steel, and enclosure. The phases which drive the project will be discussed in detail in the following section. Table 1 below gives an overview of the project and some of these phases will be summarized in order to give a quick overview of the project.

Table 1: Detailed Project Schedule Overview

Detailed Schedule Overview			
Phase	Start Date	Finish Date	Duration (Days)
Excavation/Foundation	24-Dec-2012	29-Jul-2013	152
Metro Transit	13-Mar-2013	3-Mar-2015	499
Concrete Core	24-Jul-2013	9-May-2014	202
Structural Steel	20-Nov-2013	13-Aug-2014	184
Superstructure Concrete	10-Jan-2014	21-Jul-2014	133
Envelope	24-Mar-2014	20-Feb-2015	232
Building Dried in and Water Tight (Top Down)		29-Oct-2014	1
Core Fit Out	10-Mar-2014	12-Feb-2015	237
Elevators	20-Mar-2014	23-Jan-2015	215
Interiors (Lobby, Loading Dock, Lower Levels)	9-May-2014	7-Jan-2015	170
MEPS	10-Feb-2014	28-Apr-2015	308
Full Building TCO		29-Mar-2012	1
Full Project	24-Dec-2012	29-May-2012	600

The major activities that drive the schedule of the project are as follows

- Concrete Core
- Structural Steel
- Superstructure Concrete
- Core Fit Out
- Envelope

Below in Table 2 shows the schedule of work for these trades for a typical floor.

Table 2: Schedule of Typical Floor

Schedule of Typical Floor			
Activity	Start Date	Finish Date	Duration (Days)
Install Reinf and Pour 4th Floor Core Shear Walls	29-Oct-2013	1-Nov-2013	4
Set 4th Floor Framing	30-Dec-2013	3-Jan-2014	4
Install Deck and Studs 4th Floor	23-Jan-2014	28-Jan-2014	4
4th Floor Reinforce & Pour Concrete Deck	14-Feb-2014	20-Feb-2014	4
Install Spray on Fireproofing 4th Floor	6-Mar-2014	11-Mar-2014	4
Core Fit Out 4th Floor	24-Mar-2014	12-Aug-2014	100
Install Curtainwall 4th Floor	7-Apr-2014	11-Apr-2014	5

As seen in Table 2 the average duration for each activity is four days, with each trade set a month or two apart from each other. It roughly takes six months to complete a floor. While construction of a certain trade is taken place on one floor another trade will start or be taking place on a different floor.

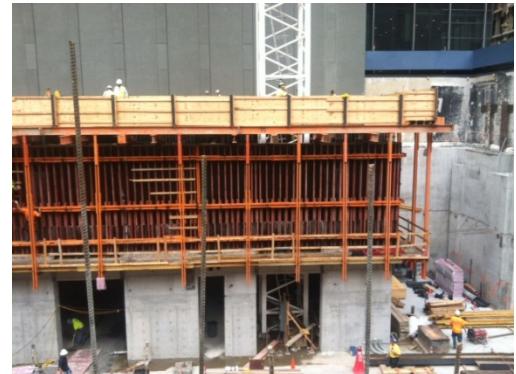

Concrete Core

With the concrete core being the first trade to start construction after the foundation wall was completed, the first seven floors for the core were critical path activities. This is because the crane for the structural steel is set to arrive the day after the seventh floor core activity is to be completed. The dates of these start and end dates can be seen in Table 3. The core follows typical high rise construction sequencing; each floor's walls will be reinforced and poured in its entirety before the hydraulic formwork moves up to the next building level. The crane located in a bay of the core is used solely for the pouring of the core walls. As mentioned earlier the average erection duration per floor is four days, with a total duration of 202 days.

Table 3: Concrete Core Erection Dates

Important Concrete Core Erection Dates		
Activity	Start Date	End Date
Layout and Install Climbing Form System	24-Jul-2013	20-Aug-2013
Install Reinforce and Pour LL2-7th Floors	20-Aug-2013	19-Nov-2013
Install Crane for Steel Erection	20-Nov-2013	4-Dec-2013
Concrete Core Completion	27-Mar-2014	1-Apr-2014

Table 2: Concrete Core Erection

Structural Steel

The structural steel phase starts immediately after that installation of the crane on December 5th 2013 with the framing of Lower Level One. Once the framing for Lower Level One is complete the Ground Floor framing and the installation of the metal deck and stud for Lower Level one will begin on the same day. The duration of the installation of the metal deck and stud for Lower Level One is ten days and immediately after the framing for the ground floor is complete the framing for the second floor will begin. It's not until the completion of the deck and studs on the ground floor and framing for the fifth floor where we see a steady construction sequence between the decking and studs for a floor and the framing for a floor. The average duration per floor is four days with the deck and studs and four days for the framing.

In Figure 1 it can be seen that activities were grouped together in order to narrow the schedule down to 200. This was done because the start date and end date for the deck and studs of a floor and framing for a floor were the same. (2nd floor deck and studs and 6th floor framing: start and end date same) The duration of the steel framing decreases to three days once the 17th floor framing begins and is because of the decrease in floor area. This occurs for the rest of the structural steel phase until its completion. Before the crane can be dismantled it will be used to hoist penthouse equipment starting on July 17th 2014. This can only occur after the hoist installation is completed on July 8th 2014. These are critical activities because the equipment has specific delivery dates and this work must be completed in time for these deliveries.

Figure 3: Excerpt from the detailed schedule. Formed by Shivam Patel

[Green Box]	Install Deck and Studs 2nd-3rd Floor, Set 6th-7th Floor Framing
[Green Box]	Install Deck and Studs 4th-5th Floor, Set 8th-9th Floor Framing
[Green Box]	Install Deck and Studs 6th-7th Floor, Set 10th-11th Floor Framing
[Green Box]	Install Deck and Studs 8th-9th Floor, Set 12th-13th Floor Framing
[Green Box]	Install Deck and Studs 10th-11th Floor, Set 14th-15th Floor Framing

**Superstructure Concrete**

Following the completion and turnover of a floor by the steel erection team the cast-in-place concrete contractor will be responsible for installing the concrete decks. This project has an average schedule lag of 15 working days between the steel turnover of a floor until the concrete workers start roughing in their work. This is to allow the structural steel team to work their way up a few floors so that there are a few layers of metal decking protecting and workers below from safety hazards such as falling debris. Once again the average duration for a floor is four days. The entire phase of the superstructure is critical work with a start date of January 10th 2014 and end date of July 21st 2014

Enclosure

As described in the first technical report the enclosure consists of high vision glass with low iron IGU with Low E coating and a mullion module of linen finish stainless steel spandrel panels. The schedule of activities for the wall enclosure starts with the curtainwall installation on the second floor on March 24th 2014 with the milestone date of October 29th 2014 for the building dried-in and water tight (top down). The curtainwall system is installed using a monorail system and the average duration is five days per floor.

Detailed Structural Systems Estimate

This detailed structural estimate will focus on the following

- Steel Beams
- Steel Columns
- Metal Decking
- Concrete Slab
- Foundation
- Concrete Columns
- Concrete Core

As this is a project with 30 levels above ground and 2 levels below takeoffs for certain floors were assessed and then averaged based on similarity. For the structural steel the number of floors which were evaluated varied between the beams columns and decking. The same for the concrete was done.

Structural Steel

Due to the shape of the building and the decreasing floor area as the building rises an accurate number for the amount of members and tonnage of steel could not be calculated for the steel framing and columns. The majority of shaped members were W with a handful of HSS and Plate Girders. Many W shaped steel members were also special order which complicated the pricing. The W shapes ranged in size anywhere from a W12x14 to W44x290. Special order beams included ones such as W36x800, W40x503, W36x362 and others.

An average price for tonnage of steel for material, labor, and installation costs was used for the beams and columns and the deck was price by square foot. Using the program Autodesk Quantity Takeoff the linear footage of the member and square footage of the decking were taken off and recorded into an Excel spreadsheet that can be seen in Appendix B1. The linear footages of each beam and column were used to calculate the amount of tonnage of steel on that specific floor. The results of this takeoff are summarized below in Tables below.

Table 4: Structural Beams Takeoff Details

Structural Beams Takeoff Details				
Description	Tonnage of Steel	# Floors	Total Ton	
Lower Level 1	44.29665	2	88.5933	
Level 1	61.642891	2	123.285782	
Level 2	61.8835	1	61.8835	
Level 5	78.173475	7	547.214325	
Level 10	309.77419	1	309.77419	
Level 15	35.496175	9	319.465575	
Level 20	37.984335	10	379.84335	
Roof	92.25	1	92.25	
Total			1922.310022	

Table 5: Steel Columns Takeoff Details

Steel Columns Takeoff Details				
Description	Tonnage of Steel	# Floors	Total Ton	
Lower Level 2	13.125	1	13.125	
Lower Level 1	12.4575	1	12.4575	
Level 1	68.2125	1	68.2125	
Level 5	30.39975	8	243.198	
Level 15	16.897	9	152.073	
Level 20	16.333	10	162.33	

Table 6: Steel Decking Takeoff Details

Steel Decking Takeoff Details				
Description	SF	# Floors	Total SF	
Lower Level 1	12604.74	2	25209.48	
Level 1	15369.25	1	15369.25	
Level 3	13991.12	1	13991.12	
Level 5	14648.54	6	87891.24	
Level 6	14613.3	1	14613.3	
Level 10	15041.08	1	15041.08	
Level 15	9457.81	9	85120.29	
Level 20	9915.49	10	99154.9	
Roof	5559.7	1	5559.7	
Total			361950.36	

As you can see the framing plans contribute the most number of tonnages of the two takeoffs. Worth noting is that the schedule calls for an average of 4 days to erect a floor of steel framing. From this the productivity of the steel erection team can be determined by dividing the total amount of steel tons (2574) by the amount of days scheduled (107). Therefore, the steel productivity must be 24 tons of steel per day to meet the construction schedule. This is a high rate of steel erection that the team is scheduled to meet and will be a challenge during the construction.

Concrete

For the concrete portion of the structural estimate the foundations, footings, slab decks, and core were all estimated. Each portion of concrete was priced by cubic yard. To determine the cubic yardage the square footage was taken off using Autodesk Quantity Takeoff, then multiplied by its thickness and divided by a conversion factor of 27. These results were recorded in an Excel spreadsheet and can be found in Appendix B2. A similar method as the steel estimate was used where an individual floor was assessed for the slab decks and core. The foundation, columns and footings were assessed by type and amount. All reinforcing was also accounted for and priced by tonnage or CSF. The concrete slabs ranged from 5 1-2" normal weight concrete to 9" normal weight concrete and the reinforcing was either # 4 rebar's or WWF 6x6-W1.4xW1.4.

The majority of the estimate was contributed from the concrete core and the concrete slabs as they are found on every floor.

The following is the total amount of cubic yard of concrete used for each concrete system.

- Slabs: 6390.6 CY
- Foundation: 780 CY
- Footings 130 CY
- Concrete Columns: 167.5 CY
- Concrete Core: 9521 CY

Pricing

Before pricing was applied to the takeoffs they were grouped together by CSI division. The only divisions that were needed for this estimate were divisions 03 Concrete and 05 Metals. The items that were grouped together in the 03 section were the concrete material, placement, finishing, reinforcing and forming. While the 05 section the structural steel and metal decking were grouped together. Using RS Means online the location factor was already accounted for in the pricing. For the structural steel portion a 10% addition for each beam was added for connections. Table 7 breaks down each division's cost and compares it back to the original estimated by Turner.

Table 7: Structural System Estimate Overview

Structural System Estimate Overview					
Division	Estimated Total Cost	Turners Estimate	\$/SF Detailed	\$/SF Turner	
03 Concrete	\$ 20,553,271.07	\$ 18,708,632.26	\$ 47.54	\$ 43.28	
05 Metals	\$ 14,088,458.30	\$ 19,550,000.00	\$ 32.60	\$ 45.22	

Note that these numbers reflect the cost of the material, labor and equipment necessary to complete the project. No overhead or profit was included in this estimate due to the fact that this could be different depending on the job or company. An overestimation for concrete was likely because of the when the rebar in the slabs entire of the building. The rebar that were in the slabs were placed each way and top and bottom. Also for the concrete core an assumption was made that rebar was all on size and placed in the same order but in reality each wall has a different layout of rebar and different types of bars.

For the metals portion, the steel beams were estimated by a tonnage and not an exact cost for the size of beam or column. This was because many of the steel members could not be found in RS Means and these certain members were special ordered due to the size. There are also plate girders and HSS type members as well. Also not every floor layout is the same for the columns and beams. An assumption was made that certain floors with a similar layout had the same amount and types of members.

Assemblies Estimate

This Assemblies Estimate will focus on the projects MEP's systems and discuss how the estimation was evaluated. This estimation will be compared to the actual system's estimate done by Turner and evaluate the accuracy of the estimate done. Table 9 below breaks down the cost by each estimate and compares the \$/SF to the original estimate done by Turner.

Table 7: Structural System Estimate Overview

Assemblies Estimate Overview						
System	Assemblies Estimated Cost	Turner's Estimated Cost	\$/SF Detailed	\$/SF/Turner		
Mechanical	\$ 10,172,657.58	\$ 17,200,000.00	\$ 23.53	\$ 39.79		
Electrical	\$ 12,056,483.69	\$ 19,728,000.00	\$ 27.89	\$ 45.63		
Plumbing	\$ 1,493,385.00	\$ 4,687,000.00	\$ 3.45	\$ 10.84		
Fire Protection	\$ 446,685.00	\$ 1,570,000.00	\$ 1.03	\$ 3.63		

Mechanical

When estimating the mechanical portion of the building it was found that not all the systems were included in RS Means. A number of systems were found and were able to be estimated to come to a difference of roughly \$7 million dollars. A detailed portion of all the systems estimated can be found in Appendix C1. The following is a list of systems that were not able to be included in the estimate

- Primary Condenser Water System
- Unit and Entrance Heaters
- Linear Diffusers
- Ceiling Supply Diffusers
- Ceiling Return Grilles and Registers
- Constant Volume Regulators

These systems can be found throughout the building and it was assumed that this accounts for a good portion of the difference. When pricing some of the systems that were between two costs an interpolation process was done. This price could be more expensive than the interpolation value because of the system being unique. With the scale of the project and the complexity of the system, specialty prices could have been assumed when the original estimate took place.

Electrical

A similar approach was taken when evaluating the electrical system of the building. Various systems were able to be estimated, but a difference of \$7.67 million was still evaluated. A detailed portion of the systems estimated can be found in Appendix C2. Again the assumption of the scale of the project and the complexity of the system is the reason for such a large difference. Also an estimation of only the service and distribution switchboard feeders was accounted for. The following is a list of systems that were not able to be included in the estimate

- Con Edison Transformers (Feeder)
- Panelboard Feeders
- Network Protectors
- Fire Alarm systems
- Security Systems

➤ Telecommunication Systems

The telecommunication, security, and fire alarm systems were not provided by the owner and could not be priced. It could also be assumed that since many of the systems are a 265/460 V – 3 phase- 4 Wires, that these systems could be priced differently from the RS Means values obtained. Values for a 260/480 V 3 phase-4wires were used.

Plumbing

For the plumbing system many systems were found but this estimation differed by \$3.2 million from the actual estimate by Turner. Appendix C3 shows the detailed systems estimate. The following systems were not be able to estimated

- Storm Water Detention Tank
- Combination Domestic – Fire Water Tank
- Duplex Ejector Pit
- Storm water Filtration pumps

These systems and the piping are assumed to cover a majority of the difference. Also many of the systems used in the estimate for the plumbing were systems that were similar to the ones used for the project but not the exact system. This is where prices can vary.

General Conditions Estimate

The general conditions estimate for the project can be considered the operating costs for the job site. It can be seen on page eleven and its cost includes personnel, field offices, temporary utilities, insurance and bonding, and other miscellaneous costs. The estimate is broken down into three main sections:

- Personnel
- Miscellaneous costs
- Insurance and bonding.

Personnel costs are the costs of the staff's salary and benefits. Miscellaneous costs are associated with items such as the field office rent, supplies, temporary utilities, telephone bills, and job clean up. Finally the insurance and bonding costs include builders risk insurance, general liability insurance, and performance bonds.

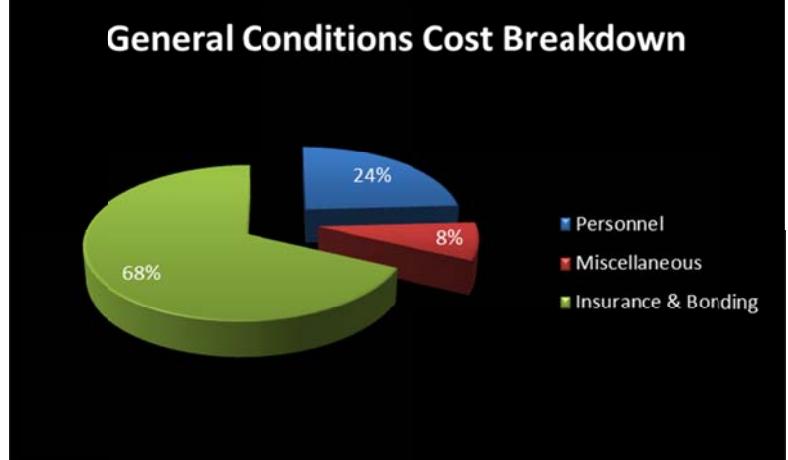

Table 8: General Conditions Summary

General Conditions Summary		
Section	Total Cost	Cost per Month
Personnel	\$ 3,780,000.00	\$ 145,384.62
Miscellaneous	\$ 1,232,021.33	\$ 47,385.44
Insurance & Bonding	\$ 10,649,600.00	\$ 409,600.00
Totals	\$ 15,661,621.33	\$ 602,370.05

The general conditions estimate is based off a 26 month construction schedule. From this the monthly cost for each cost breakdown can be determined. This along with a summary of the general conditions estimate can be seen above in Table 8. The total estimate came out to be \$15,661,621 for the project, and a cost per month of \$602,370.05. The pricing was obtained from 2013 RS Means Construction Cost Data. The most costly general conditions section was the insurance and bonding at 68%, followed by the personnel section at 24%. The miscellaneous section makes up the rest with 9%. This can be seen in Figure 2.

The insurance and bonding section is higher than the other sections due to high contract value of the project which is \$208 million. Turner estimated the general conditions to be \$18.7M so these two estimated match up closely. Turner did not release the details of their general conditions estimate so the sub sections of the estimate cannot be compared in detail.

Figure 3: General Conditions Cost Breakdown

As seen in the estimate various miscellaneous costs were chosen. These were chosen as an assumption based off viewing the site logistic plans Turner had provided. Costs such as barriers, cranes, security, hoists, and safety netting were all included.

Table 9: General Conditions Estimate

General Conditions Estimate					
Description	EA	Quantity	Unit	Rate	Total Cost
Personnel Costs					
Project Manager	1	105	Week	\$ 3,400.00	\$ 357,000.00
Project Engineer	1	105	Week	\$ 2,800.00	\$ 294,000.00
Project Superintendent	1	105	Week	\$ 3,200.00	\$ 336,000.00
Superintendent	3	105	Week	\$ 2,900.00	\$ 913,500.00
Engineer	7	105	Week	\$ 1,800.00	\$ 1,323,000.00
Safety	1	105	Week	\$ 2,700.00	\$ 283,500.00

					\$ 15,661,621.33

Site Layout Planning

Three main phases of construction were analyzed and from this site layouts were created. The following are the three phases analyzed.

- Excavation
- Superstructure: Level 10 – Roof
- Exterior Envelope & Roof/Bulkhead

In this section each phase will be discussed in detail and key features will be discussed. In each phase a similar approach was used as Turner due to the size of the site and its restrictions. Each phase can be seen in Appendix D

Excavation

Going back to the schedule the Excavation phase begins on December 24th 2012 and ends on July 29th 2013. The detailed site layout can be seen in Appendix D. The safety for this phase is very important because of surrounding streets and MTA tunnels. As seen in the layout, an excavation of 34 feet was done. A dirt ramp is used in order to bring the excavated dirt away from the site. As the site is very tight and surrounded by three one way streets, lanes were closed in order to extend the site. A temporary path for pedestrians was designed and is guarded by jersey barriers. It is also important to note that there is an existing subway entrance still used during this phase of construction. Also during this phase of construction the subcontractor trailers are placed on the existing sidewalk. Guardrails are protecting all sides of the excavation as well. Vehicles will enter through the site through one of the six gates around the site. The project location is in a major city and in this city, the excavation must follow a code of having to means of ingress and egress that is kept available all times. This is covered by the ramp and stairs seen in the layout.

Superstructure: Level 10 – Roof

The superstructure phase from level 10 – roof was chosen in order to show the complexity of this site in greater detail. The site is very cluttered. During this phase there are two cranes present on site with loading stations very close to the building. The following are items that are different from the excavation phase to this superstructure phase

- News stand torn down
- MTA entrance closed
- Netting used to protect floors below as structural framing is set.
- Site Fence extended due to news station tear down
- 17' 3" between building and site fence
- Overhead protection installed
- Subcontractor Trailers move into building.
- Standpipes and Stairs within Concrete Core

The site fence being extended allows for loading stations to be within the site perimeter. The area where the contractor trailers were has become the layout areas for concrete and steel. These temporary facilities have moved within the interior floors that have been completed. The steel crane is used for the steel framing, while the concrete crane is used for pouring the concrete core at the high levels using a bucket. Each floor is poured using the concrete trucks seen at the northern portion of the site. During this phase it is critical for pedestrian protection hence the construction of overhead protections above the temporary path created in the earlier phase. Also communication between the concrete crane crew and steel crane crew is critical as both are in the radius of each other. As part of the city's fire department requires an active standpipe within 50ft. The department of buildings also requires two paths of egress within the core.

Exterior Envelope & Roof/Bulkhead

This is the final phase that involves the use of a crane and hoists. Once this phase is completed the focus turns to the interior floors that remain. This phase is important because once this is completed the building will be dried and water tight. The following are items that are different from the superstructure phase to the envelope phase and can be seen in Appendix D3

- Concrete Crane dismantled
- Protective netting no longer required
- Mechanical equipment is being installed
- Trolley Beam system to be engineered for the west side curtain wall system

This phase moves into full effect after the roof slab has been fully set and the concrete crane has been dismantled. There are only a handful of levels that the exterior curtain wall need to be installed on. The steel crane is still available to finish the remaining steel on the roof and hoist assist. A trolley beam system was engineered in the previous phase but was not able to be seen. It is shown in Appendix D3. This is used to install the west side curtain wall as the space between the project and the adjacent building is very narrow.

Constructability Challenges

This section will provide insight into some of the constructability challenges that the project team has had to face during the construction of the project. Some of the main constructability issues have arisen from the downtown site location and the constraints that come along with that. The following issues are ones that will be discussed in detail

- Excavation, Foundation, and Support of Excavation
- Construction of Utility Lines
- Public Safety

Excavation, Foundation and Support of Excavation

With the project having just a tight and cluttered site the importance of SOE and the Foundation is critical. As mentioned earlier the site is surrounded by three one way streets. Also there is metro tunnel that runs next to the site on the east side. With the excavation 34 feet below the side walk the existing subway wall needed support. In order to properly support the surrounding streets and subway tunnel the excavation had to be done in stages. Solider piles were used as support and were lagged in between. A photo of this system can be seen in Figure 4. Turner also utilized three steel walers for extra support. This can be seen in Figure 5

Figure 4: Support of Excavation

Figure 5: Waler support

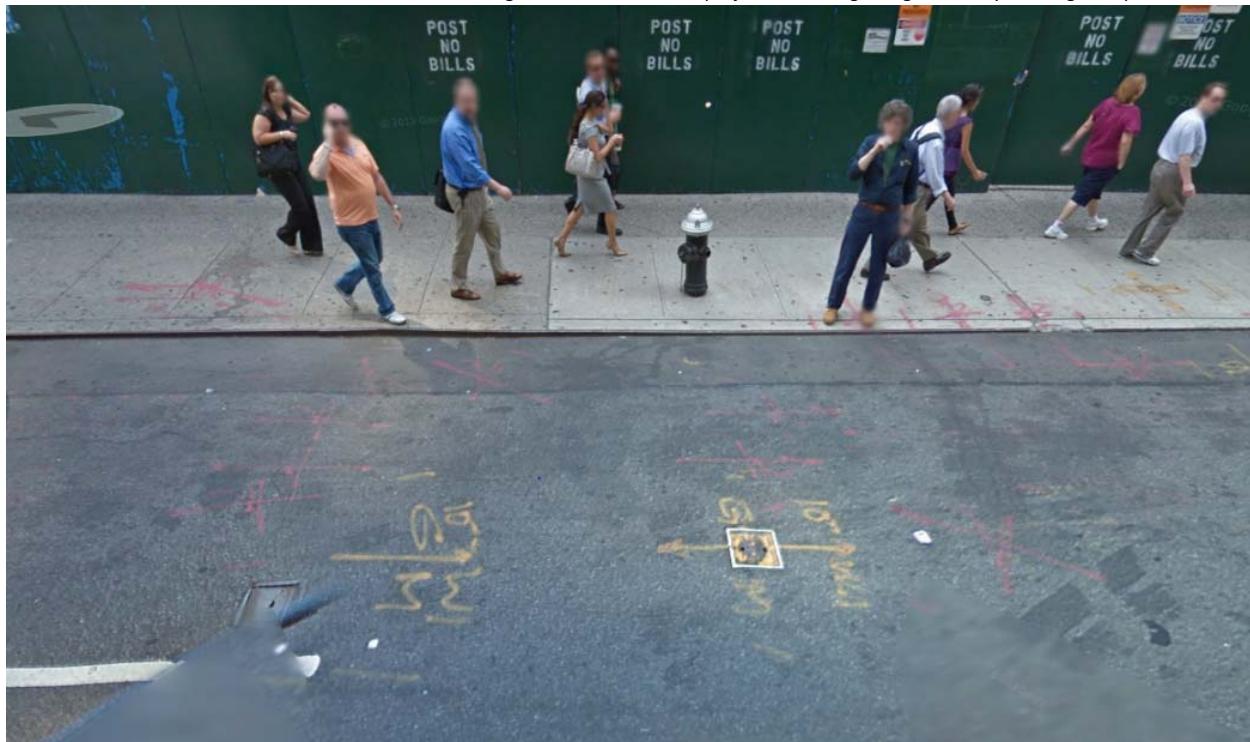

Construction of Utility Lines

Various utility lines such as telecommunication, electrical, gas and sanitary need to be brought into the building from both the north and south ends of the building. Again because of those streets being one lane and one way, the utilities lines were brought in during the night time. Various permits were pursued to bring these lines in during night time, and Turner pursued to close the north and south streets during the construction but was only able to secure permits. All utility lines are coming from an existing main, or tapped into the various manholes surrounding the site. In order to bring these lines in the streets were trenched and dug out. A partial photo of where the trenching occurs before construction started can be seen in Figure 6

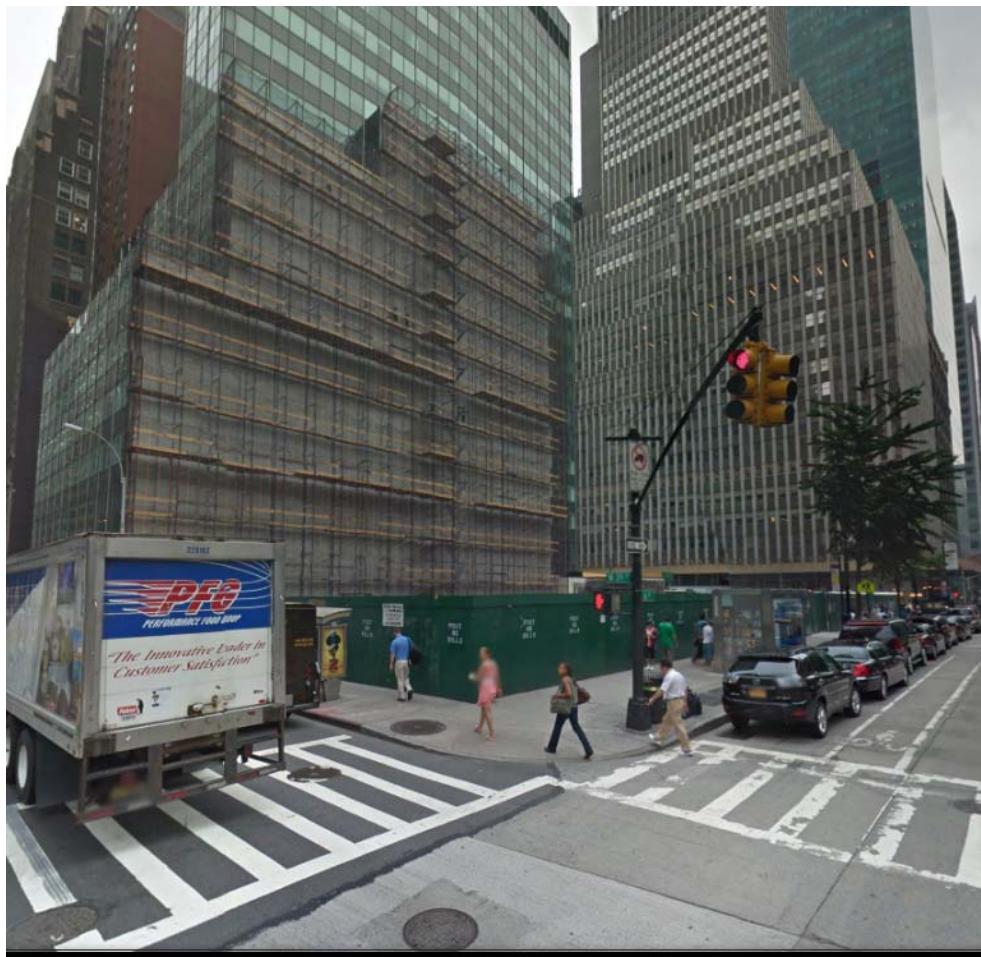

Figure 6: North street of project, trenching: Image courtesy of Google maps

**Public Safety**

Another construction issue that arises from the downtown location is preserving the safety of the public. The site is located in a downtown location that is in the middle of developing shopping, restaurant, and bar area. Because of this there will be a very high level of pedestrian activity during and after work hours on the site. In order to protect the public Turner implemented a few safety measures. An eight foot high site fence was built around the perimeter of the site. There is signage throughout the temporary walkway warning the public of the construction zone. The green barrier seen in Figure 7 is footprint of the project and excavation will be occurring to there. The site fence for the start of the project covers the sidewalk and the temporary walkway is where the cars are currently parked. This walkway is surrounded by jersey barriers and once the steel phase begins overhead protection will be constructed over that temporary walkway. There are four gates and a staff member will be stationed at each insuring nobody from the public enter the site unless they are required to and have the proper personal protective equipment. They will also be responsible for directing deliveries.

LEED Evaluation

This section will detail the process of a LEED evaluation by comparing a checklist based upon the Penn State approach, and the actual approach used by Turner. The Tower is aiming for LEED Gold and through the various systems, and site sustainability it is well on its way to achieving this goal. The architect, owner, and the company Viridian as all coordinating with each other in order to achieve a total of 60 points. The following categories need to be evaluated. Each has a one or more prerequisites in order to pursue that category and all were determined possible to pursue.

- Sustainable Sites: 28 points
- Water Efficiency: 10 points
- Energy Atmosphere: 37 points
- Materials & Resources: 13 points
- Indoor Environmental Quality: 12 points
- Innovative Design Process: 6 points
- Regional Priorities: 4 points

After evaluating each category it was found that after evaluating the project using the Penn State approach a total of 64 points was accounted for. This differs from the actual approach that Turner used by 3 points (61). Turner added an extra column with “less likely” points. This is because some of these points are less likely to achieve because of core and shell design. These checklists can be seen in Appendix E. The following will detail how each point was determined with only the mandatory credits.

Sustainable Sites

Out of a total 28 points 22 points were accounted for. The prerequisite for this category is to reduce pollution from construction activities by controlling soil erosion by creating and implementing an erosion sedimentation plan. This plan was already created by Viridian allowing to pursue LEED points in this category.

- Alternative Transportation – Public Transportation Area: 6 points were awarded in this category because the project is located within a $\frac{1}{2}$ mile walking distance of an existing subway station.
- Tenant Design & Construction Guidelines: With this being a core and shell project the tenants can be educated about implementing sustainable design and construction features. In order to achieve this point an illustrated document must be created with information about the sustainable design and construction features incorporated within the project. Also information that enables a tenant to coordinate space design and construction with the projects building systems

- Stormwater Design: Quality Control: The purpose of this is to increasing on-site infiltration. In order to achieve this point a stormwater management plan must be implemented. With the building having a stormwater detention tank it was assumed this plan is already implemented.

Energy and Atmosphere

15 out of a total 37 points were obtained when pursuing this LEED category. The prerequisite that was chosen was the Fundamental Commissioning of the Building Energy Systems which a member of the project team to work with a CX agent in implementing a commissioning plan, and collect documentation.

- Enhanced Commissioning: This credit is awarded if the commissioning process begins early in the design process and executes addition activities after systems performance verification is completed. Viridian is the CxA and has done all the requirements in order to achieve these points.
- Green Power: To encourage the development and use of grid-source, renewable energy technologies on a net zero pollution. Either by determining the Baseline Electricity use or estimating this value can result in being awarded these points.

Materials and Resources

Six out of 13 points were obtained when evaluating this category. By providing an easily-accessible dedicated area or area for the collection and storage of materials for recycling opens this category for evaluation.

- Construction Waste Management: Divert 50-75% from disposal: By developing a waste management plan which identifies the materials to be recycled or salvaged will award points in this category.
- Certified Wood: Using minimum of 50% of wood based materials and products certified with the FSC for wood building components will award points in this category.
(Formwork)

Indoor Environmental Quality

11 out of a total 12 points was obtained. By preventing smoking in the building or 25 feet from the entries allows this category to be evaluated.

- Construction indoor Air Quality Management Plan – During Construction: By developing and implementing an IAQ management plan after installation of all finishes and completion of building cleaning before occupancy the point for this category can be awarded

Innovation and Design Process

3 out of 6 possible points was achieved after evaluation. A credit in design that can be achieved is Exemplary Performance in SSc4.1 (Transportation Access). With the metro tunnel addition this credit is awarded for also implementing a new access point for an existing subway station

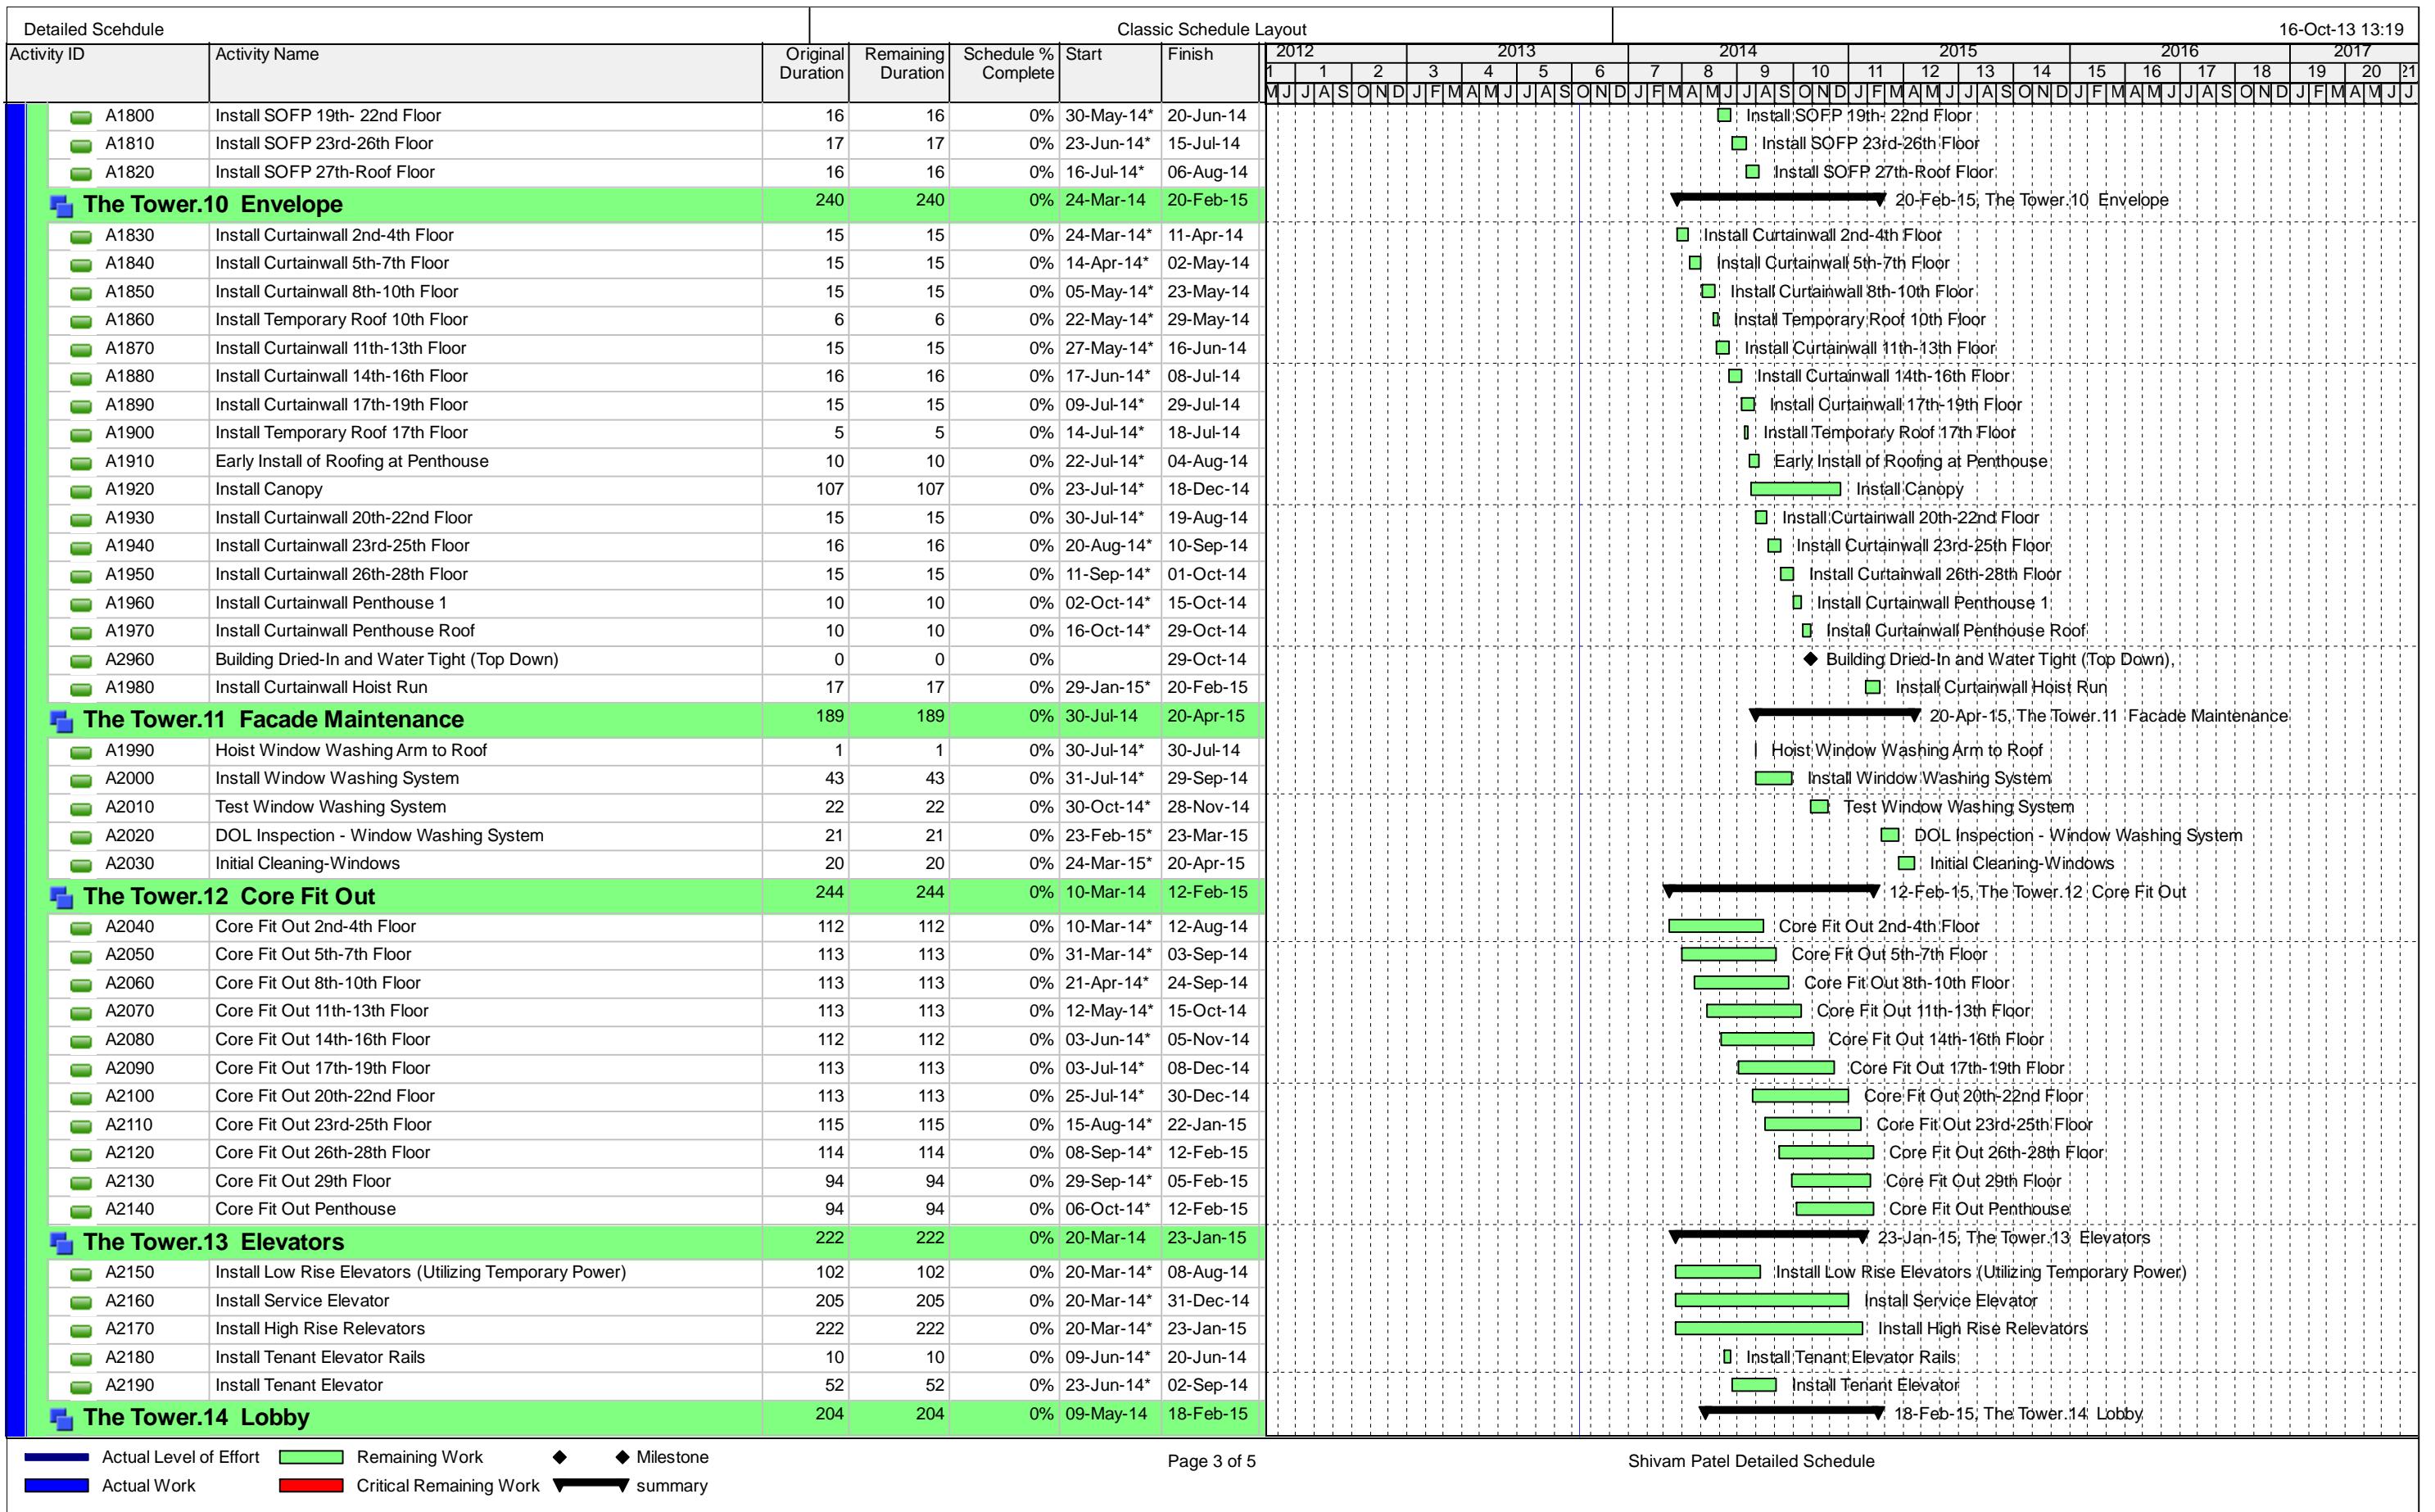

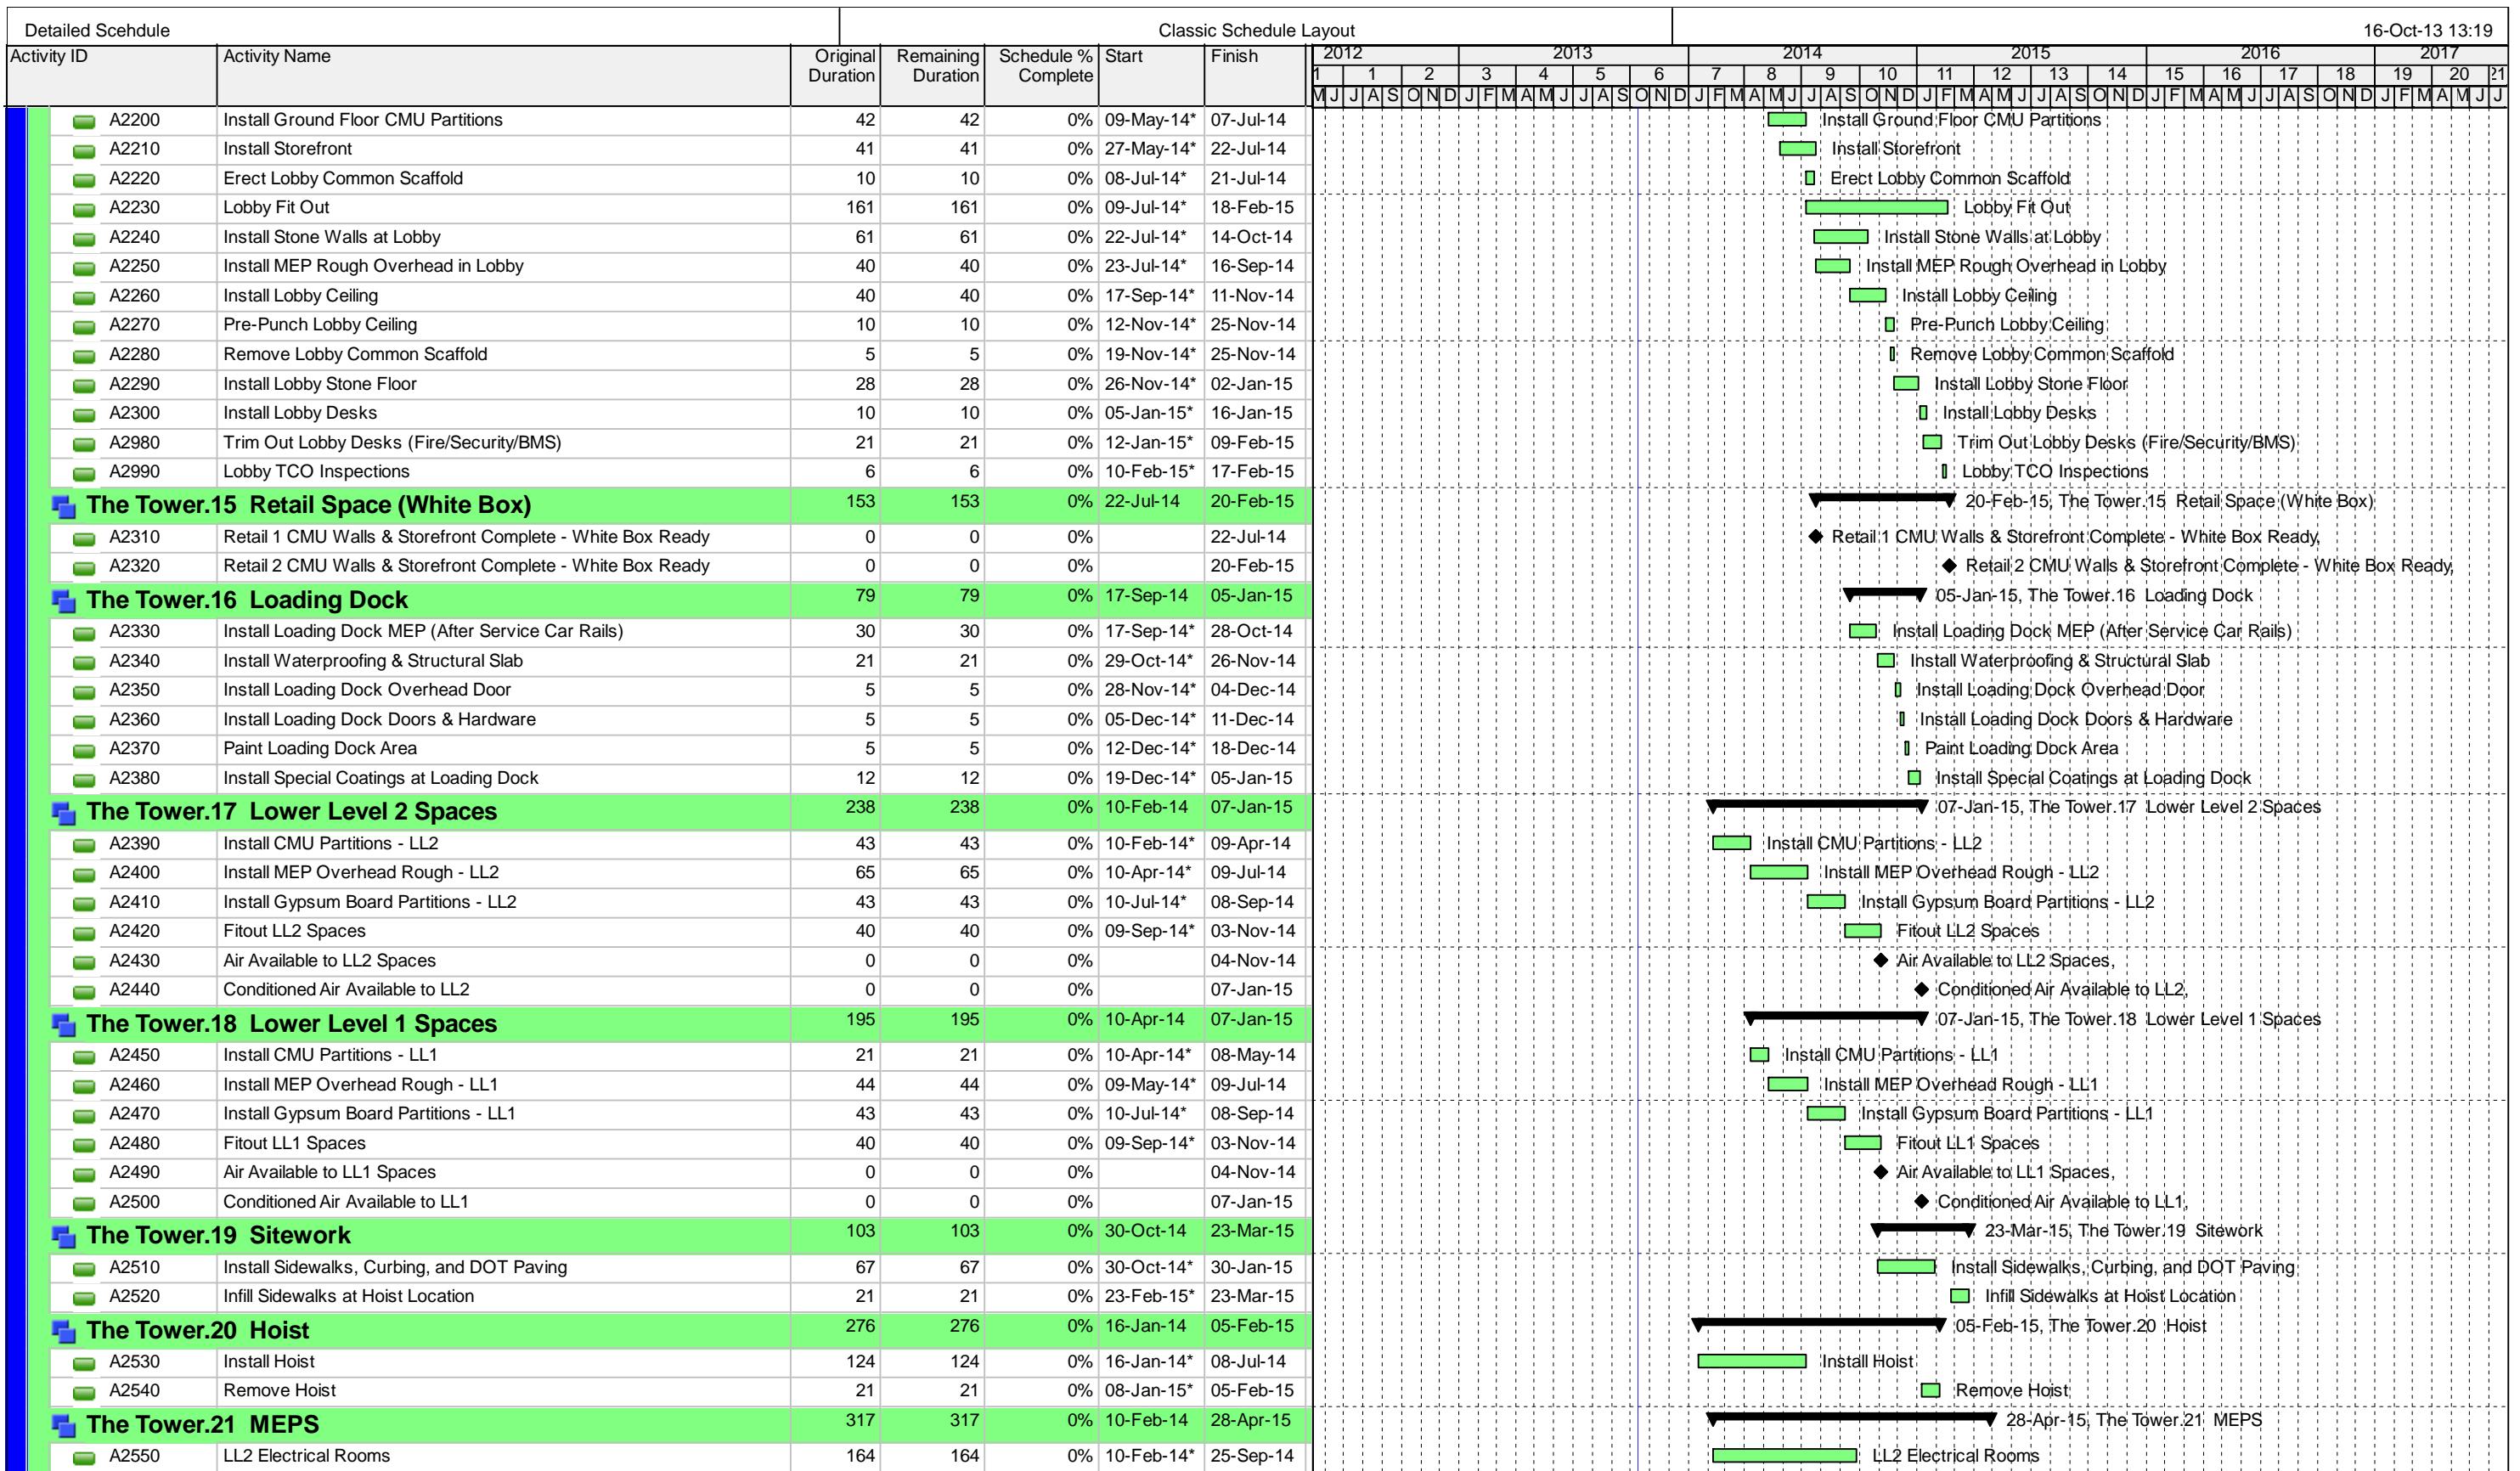

Appendix A: Detailed Project Schedule

The legend consists of two rows of colored boxes and text labels. The first row contains: a dark blue box labeled 'Actual Level of Effort', a light green box labeled 'Remaining Work', an empty diamond symbol labeled 'Milestone', and another empty diamond symbol. The second row contains: a bright blue box labeled 'Actual Work', a red box labeled 'Critical Remaining Work', a downward-pointing triangle symbol, and a right-pointing arrow symbol labeled 'summary'.

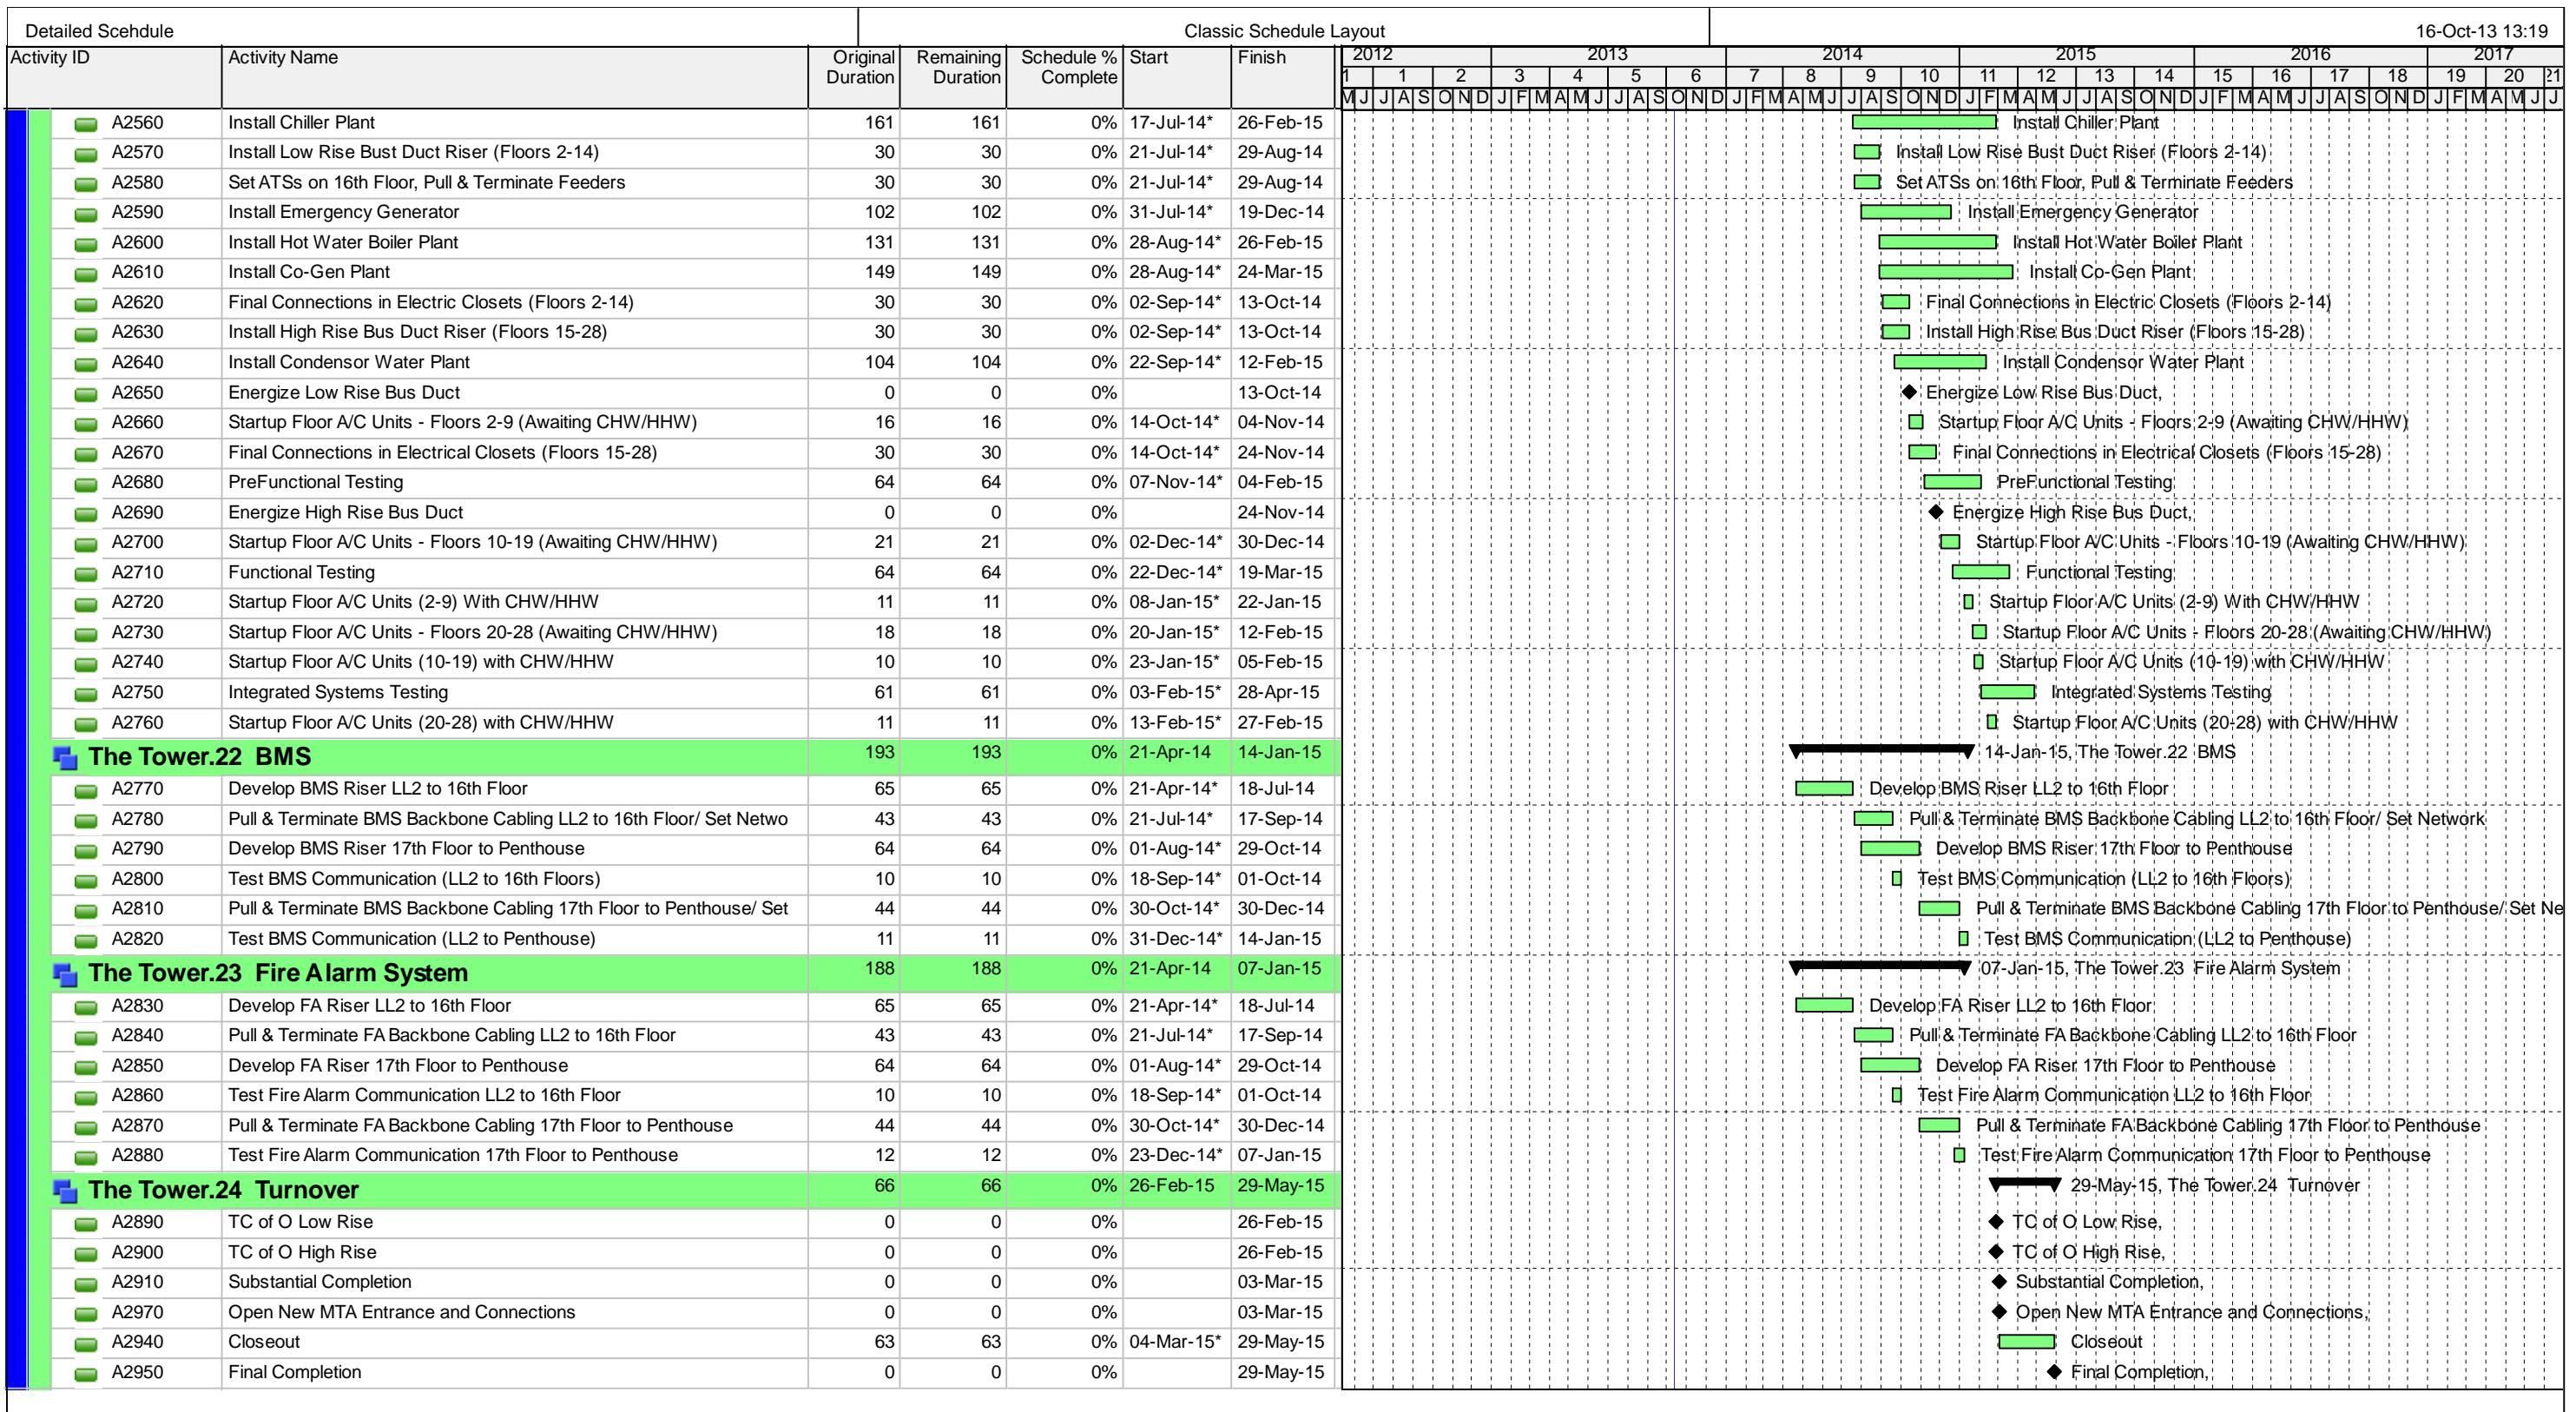

The legend consists of six items arranged horizontally:

- Actual Level of Effort (represented by a blue bar)
- Remaining Work (represented by a green bar)
- Milestone (represented by a black diamond marker)
- Actual Work (represented by a blue bar)
- Critical Remaining Work (represented by a red bar)
- summary (represented by a black arrow pointing right)

Project Checklist

Project Name

Date

22 1 2	Sustainable Sites	Possible Points: 28	6 1 6	Materials and Resources	Possible Points: 13
Y	?	N	Y	?	N
Y	Prereq 1	Construction Activity Pollution Prevention		Prereq 1	Storage and Collection of Recyclables
1	Credit 1	Site Selection	1	Credit 1	Building Reuse—Maintain Existing Walls, Floors, and Roof
5	Credit 2	Development Density and Community Connectivity	5	Credit 2	Construction Waste Management
1	Credit 3	Brownfield Redevelopment	1	Credit 3	Materials Reuse
6	Credit 4.1	Alternative Transportation—Public Transportation Access	6	Credit 4	Recycled Content
2	Credit 4.2	Alternative Transportation—Bicycle Storage and Changing Rooms	2	Credit 5	Regional Materials
	Credit 4.3	Alternative Transportation—Low-Emitting and Fuel-Efficient Vehicles	3	Credit 6	Certified Wood
2	Credit 4.4	Alternative Transportation—Parking Capacity	2		
1	Credit 5.1	Site Development—Protect or Restore Habitat	1		
1	Credit 5.2	Site Development—Maximize Open Space	1		
1	Credit 6.1	Stormwater Design—Quantity Control	1		
1	Credit 6.2	Stormwater Design—Quality Control	1		
1	Credit 7.1	Heat Island Effect—Non-roof	1		
1	Credit 7.2	Heat Island Effect—Roof	1		
1	Credit 8	Light Pollution Reduction	1		
1	Credit 9	Tenant Design and Construction Guidelines	1		
6 1 3	Water Efficiency	Possible Points: 10	11 1 1	Indoor Environmental Quality	Possible Points: 12
Y	Prereq 1	Water Use Reduction—20% Reduction		Prereq 1	Minimum Indoor Air Quality Performance
4	Credit 1	Water Efficient Landscaping	2 to 4	Prereq 2	Environmental Tobacco Smoke (ETS) Control
	2	Innovative Wastewater Technologies	2	1	Outdoor Air Delivery Monitoring
2	1	Credit 3	2 to 4	1	Increased Ventilation
				1	Construction IAQ Management Plan—During Construction
				1	Low-Emitting Materials—Adhesives and Sealants
				1	Low-Emitting Materials—Paints and Coatings
				1	Low-Emitting Materials—Flooring Systems
				1	Low-Emitting Materials—Composite Wood and Agrifiber Products
				1	Indoor Chemical and Pollutant Source Control
				1	Controllability of Systems—Thermal Comfort
				1	Thermal Comfort—Design
				1	Credit 8.1 Daylight and Views—Daylight
				1	Credit 8.2 Daylight and Views—Views
15 3 19	Energy and Atmosphere	Possible Points: 37	3 1 1	Innovation and Design Process	Possible Points: 6
Y	Prereq 1	Fundamental Commissioning of Building Energy Systems		1	Credit 1.1 Innovation in Design: Green House Keeping Plan
Y	Prereq 2	Minimum Energy Performance		1	Credit 1.2 Exemplary Performance in SSC4.1 (Transportation Access)
Y	Prereq 3	Fundamental Refrigerant Management		1	Credit 1.3 Exemplary Performance in SSC2 (Development Density)
3 3 15	Credit 1	Optimize Energy Performance	3 to 21	1	Credit 1.4 Innovation in Design: Specific Title
	4	Credit 2	4	1	Credit 1.5 Innovation in Design: Specific Title
2	Credit 3	On-Site Renewable Energy	2	1	Credit 2 LEED Accredited Professional
2	Credit 4	Enhanced Commissioning	2		
3	Credit 5.1	Enhanced Refrigerant Management	3		
3	Credit 5.2	Measurement and Verification—Base Building	3		
2	Credit 6	Measurement and Verification—Tenant Submetering	2		
		Green Power			
1 1 1	Regional Priority Credits	Possible Points: 4	1 1 1	Total	Possible Points: 110
1	Credit 1.1	Regional Priority: Stormwater Design		64 6 31	
	Credit 1.2	Regional Priority: Specific Credit			Certified 40 to 49 points
	Credit 1.3	Regional Priority: Specific Credit			Silver 50 to 59 points
	Credit 1.4	Regional Priority: Specific Credit			Gold 60 to 79 points
					Platinum 80 to 110
